1. Overview

This guide will attempt to show users how to set up two Ubiquiti pieces of equipment, to provide for a secure and flexible firewall / router and a Wi-Fi Access Point. The two pieces of equipment used in this guide are:

- Ubiquiti EdgeRouter X (about \$50 when this guide was written)
- Ubiquiti AP-AC-LR Wi-Fi Access Point (about \$100 when this guide was written).

This equipment can provide 3 isolated or semi-isolated wired networks, and up to 4 isolated or semi-isolated Wi-Fi SSIDs. The networks provided by this equipment configuration are as follows:

- Wired Home Network For most of the household personal computers
- Wired Separate Network For an isolated and/or separate network and/or personal computer(s)
- Wired IOT Network For wired Internet-Of-Things devices
- Wi-Fi Home Network For household personal computers, tablets and smartphones
- Wi-Fi Guest Network For visiting friends' tablets and smartphones
- Wi-Fi IOT Network For Wi-Fi Internet-Of-Things devices

The Wired Home Network and Wi-Fi Home Network is actually the same Network. Your naming and use may / can be different. See Figure 1 - Overview Diagram.

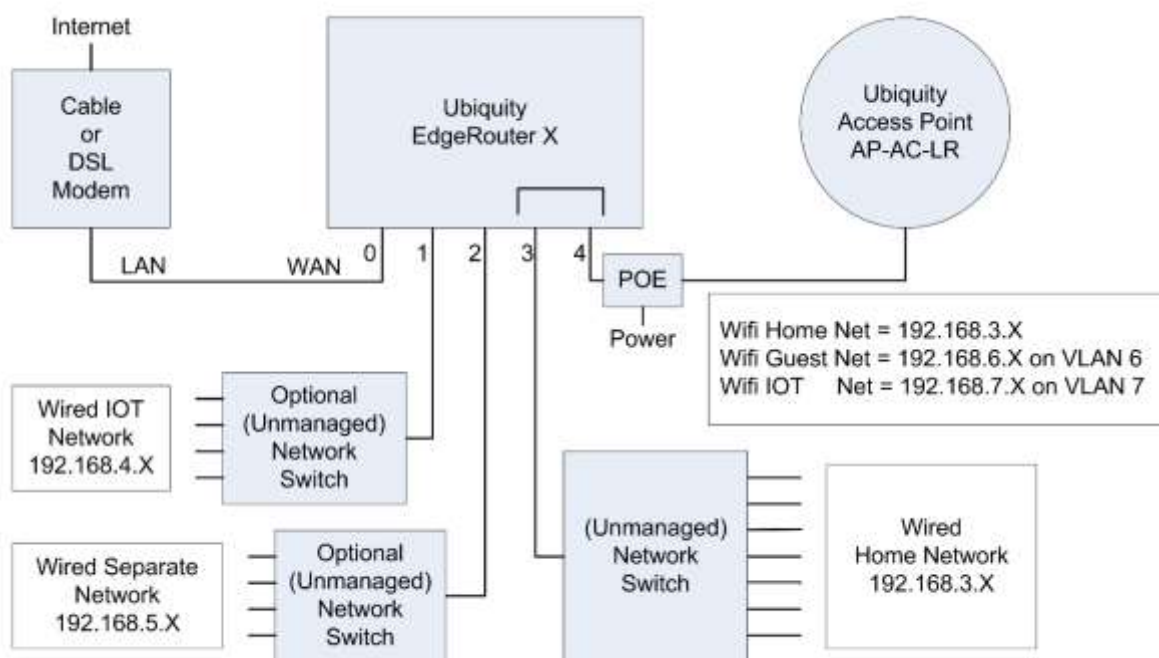

Figure 1 - Overview Diagram

With this setup, the Home Network (both Wired and Wi-Fi) is able to initiate connections / communicate with devices on both the Wired IOT Network and the Wi-Fi IOT Network. Devices on the IOT Networks are NOT able to initiate connections / independently communicate to the Home Network. None of these Networks can communicate with the Wired Separate Network, and the Wired Separate Network cannot communicate with them.

This guide assumes that you will be using both an Ubiquiti EdgeRouter X (ER-X) and some model of Ubiquiti Access Point (UAP). I tend to use the terms ER-X and EdgeRouter somewhat interchangeable within this guide.

2. Disclaimer

This is a guide, your results may vary. I am not a network engineer. Enough said.

3. Purpose

One purpose of this guide is to provide a stable and usable router / firewall / access point configuration.

Another purpose is to provide background on what these configuration settings accomplish, so that the reader can understand why these settings were chosen.

I wrote this guide because I REALLY like this router.

I was mostly motivated to switch routers by reading <http://routersecurity.org/> and <http://routersecurity.org/bugs.php>. This website should scare just about anybody that is currently using consumer / commercial routers. I'm so glad to be finished with that buggy equipment.

The only trouble with this router is that it is meant for professionals to use. You have to scrounge around forums for postings on how to configure specific items. This doesn't mean that the forum people are not friendly, just that the needed answers are not all in one place. Sometimes the answers are a little bit terse for a new user. As stated, I am not a network engineer.

This guide is the documentation, for the configuration that I setup for myself. It took me a huge amount of time to put this document together. I've tried to write this guide in a teaching manner, and cite references where I could. Note that I specifically call this a 'guide'. When you go through this document you should: experiment, modify, learn, tinker and play, extend, and learn some more. Mix and match the sections as you see fit.

Most of my source information came from reading postings at:

<https://community.ubnt.com/t5/EdgeMAX/bd-p/EdgeMAX>

When this document was ready, I joined the Ubiquiti community and announced it at:

<https://community.ubnt.com/t5/EdgeMAX/New-ERX-AC-AP-LR-setup-guide-for-beginners/td-p/1906477>

If you have specific questions about this configuration, your best bet is to research postings at the above EdgeMax link, then try and experiment for yourself. If you get stuck, then join the Ubiquiti community and ask. I've now purchased an additional ER-X router to continue experimenting and for use in refining this guide.

Note that the associated backup file(s) on github are not being actively maintained or updated with later changes being made in this guide. It is there as a reference.

4. EdgeRouter IP Address Use

For the purposes of this guide, I am assuming that you will put your Ubiquiti EdgeRouter in series with your existing firewall / router, after the EdgeRouter has been initially configured. This way, you can leave your existing network alone, while securely setting up and testing your EdgeRouter. You need to ensure that your existing network does not use any of the following network addresses: 192.168.3.X, 192.168.4.X, 192.168.5.X, 192.168.6.X, or 192.168.7.X, as these address ranges will be used within the EdgeRouter. I suggest that you set up or re-configure your existing router to use IP addresses of 192.168.2.X on its LAN ports. Existing router addresses of 192.168.0.X or 192.168.1.X will also work. Your existing equipment may have the “Cable or DSL Modem” portion and “Your Existing Firewall / Router” portion combined into one single unit. See Figure 2 - EdgeRouter Configuration Setup. You will also need a computer to setup the EdgeRouter.

Figure 2 - EdgeRouter Configuration Setup

Most cable / DSL modems seem to be pre-configured for DHCP, and for using addresses of 192.168.0.X or 192.168.1.X on their LAN ports. Therefore, I configured the EdgeRouter Network addresses not to include those ranges. I deliberately left the address range of 192.168.2.X unused within the EdgeRouter, so those addresses could be used by an existing firewall / router's LAN ports.

If the EdgeRouter was using an address that was also used by your Cable / DSL modem, it would mask / hide that equipment's setup web page(s), and you would not be able to access those pages.

The EdgeRouter will NOT work if the address presented via DHCP to its eth0 port maps anywhere within one of the address ranges used internally by the EdgeRouter.

If your Internet Service Provider's (ISP) equipment does not provide an IP address via DHCP, then you will need to adjust your WAN (eth0) settings after running the setup wizard. In particular, if you need to use PPPoE, then you might want to read:

<https://community.ubnt.com/t5/EdgeMAX/Can-t-open-some-webpages/m-p/1950743/highlight/true#M163311>
<https://samuel.kadolph.com/2015/02/mtu-and-tcp-mss-when-using-pppoe-2/>

5. Acquire EdgeRouter Documentation

On the computer you use to setup the EdgeRouter X, download the newest documentation from:

<https://www.ubnt.com/download/edgemax/edgerouter-x/er-x>

There are both a User's Guide and a Quick Start Guide.

Note that Ubiquiti makes several models of EdgeRouter equipment. Each model uses different hardware, has different capabilities, supports a different number of ports, and may be configured (sometimes subtly) differently from each other. For instance, the EdgeRouter Lite typically uses eth1 as its WAN port, while the EdgeRouter X typically uses eth0 as its WAN port. Watch out for these types of differences when doing internet searches. EdgeMAX is the operating system for the EdgeRouter series.

<https://help.ubnt.com/hc/en-us/articles/218889067-EdgeMAX-How-to-Protect-a-Guest-Network-on-EdgeRouter>

7. Initial EdgeRouter Hardware Setup

Configure the setup computer's Ethernet jack as having a fixed IP address of 192.168.1.X (where X is 2 to 254), and a netmask of 255.255.255.0. There are many tutorials available on the internet that shows how to configure a computer's Ethernet port to use a fixed IP address. One way to configure a Windows 10 computer is:

Control Panel -> Network & Internet -> Ethernet -> Change Adapter Settings -> Internet Protocol Version 4 -> Properties -> Use the following IP address.

See Figure 3 – Windows 10 Ethernet Address Setup.

Figure 3 – Windows 10 Ethernet Address Setup

Power up your EdgeRouter X using the supplied power adapter, and then depress and hold the reset button for about 15 seconds. After releasing the reset button, connect a standard Ethernet cable from the EdgeRouter's eth0 port to the setup computer's Ethernet jack. See Figure 4 – Initial EdgeRouter Hardware Setup.

Note that some setup computers may have an additional Ethernet adapter or have an additional Wi-Fi adapter installed. If any additional adapter(s) are installed, and an adapter is using or connecting to an address within the range of 192.168.1.X, then you will need to temporarily disable that additional adapter. The additional adapter only needs to be disabled while you are trying to access the EdgeRouter at its initial hardware setup address of 192.168.1.1.

Figure 4 – Initial EdgeRouter Hardware Setup

Reference Quick Start Guide and the User's Guide @Chapter 2:Using EdgeOS.

8. Initial EdgeRouter Login

Wait about three minutes for the EdgeRouter to boot up, then open a web browser of your choice on your setup computer and enter <https://192.168.1.1> into the address field. The browser may issue a security warning. You will need to “Continue to this web site” or equivalent. The exact prompts and responses vary by browser. See Figure 5 – IE Security Certificate Example.

Figure 5 – IE Security Certificate Example

You will likely see a combined login and license agreement dialog. Enter the username and password. The default username is “ubnt” and the default password is “ubnt”. Do what you need to do for the agreement. See Figure 6 – Ubiquiti License Agreement Dialog.

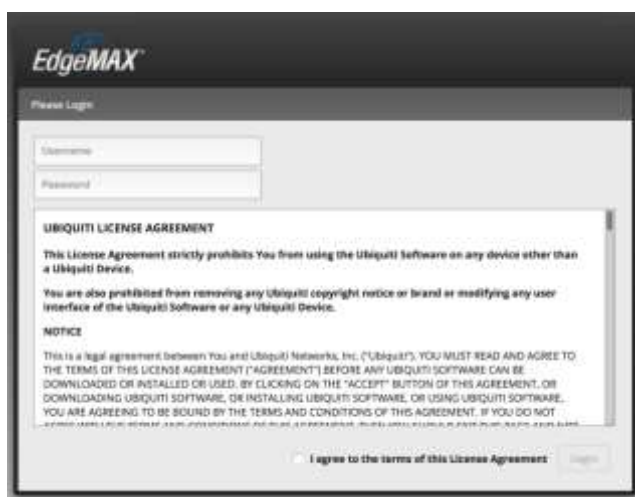

Figure 6 – Ubiquiti License Agreement Dialog

Depending upon the version of firmware that was pre-installed on your EdgeRouter, you may be presented with a dialog box stating that the “Router is in default config. Do you want to start with the Basic Setup wizard?” If presented, answer No. See Figure 7 – Basic Setup Question.

Figure 7 – Basic Setup Question

You will land on the Dashboard screen. See Figure 8 – Initial Dashboard Screen.

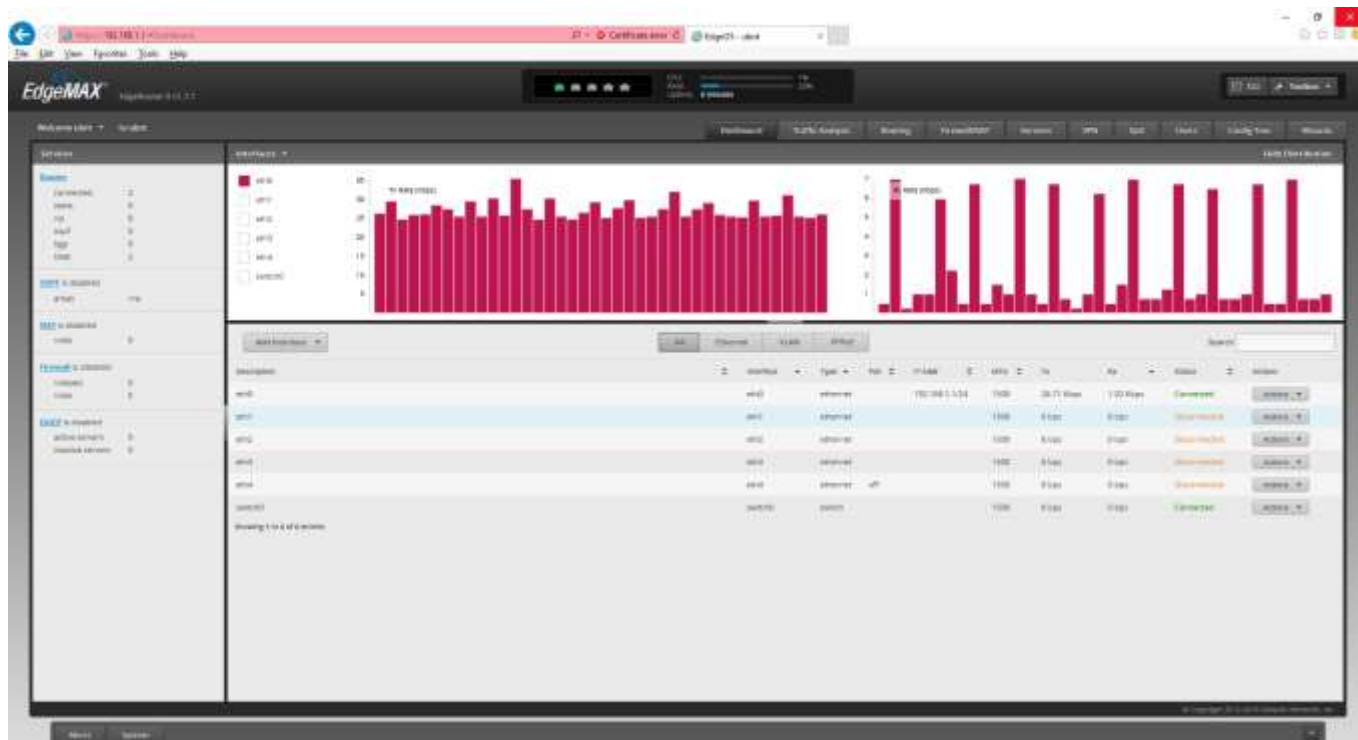

Figure 8 – Initial Dashboard Screen

Reference Quick Start Guide and the User's Guide @Chapter 2:Using EdgeOS.

9. Update EdgeRouter Firmware

On your setup computer, download the NEWEST firmware from:

<https://www.ubnt.com/download/edgemax/edgerouter-x/er-x>

For reference, during the writing of this document, the firmware was at:

"EdgeRouter ER-X/ER-X-SFP/EP-R6: Firmware v1.9.1".

Press the "System" button. See Figure 9 – System Button. This button is located near the lower-left corner of the dashboard screen, as shown in Figure 8 – Initial Dashboard Screen.

Figure 9 – System Button

Sometimes the System button and/or the Alerts button, which is right next to the System button, don't seem to work for me. I usually just click the other button twice, and then click the button I want.

You might want to join the Ubiquiti community and sign up for notifications about new software / firmware updates. You could also just periodically poll the above link, looking for new updates. It is probably a good idea to keep (somewhat) up to date firmware on your EdgeRouter, for security updates.

The System window will then pop-up an overlay that will cover most of your screen. See Figure 10 – System Pop-up Screen.

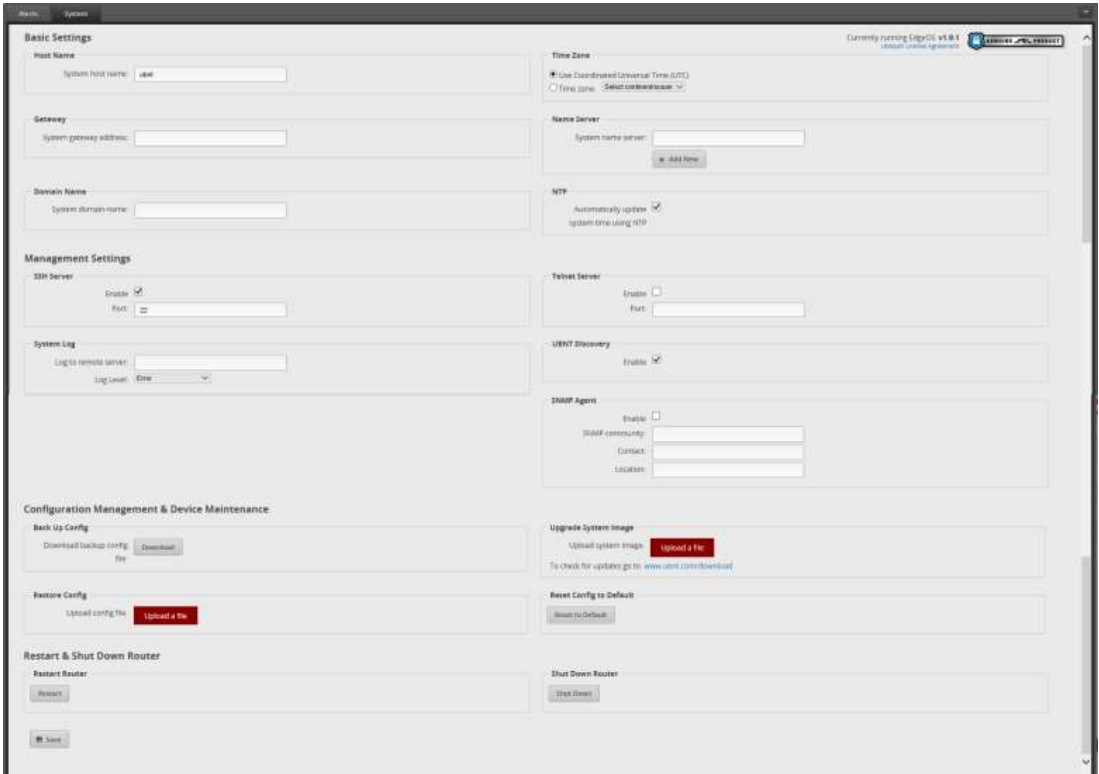

Figure 10 – System Pop-up Screen

Find the “Upgrade System Image” section, and press the “Upload a file” button. See Figure 11 – Upgrade System Image.

Figure 11 – Upgrade System Image

Choose the firmware file that you downloaded earlier. The EdgeRouter will then install the chosen file. See Figure 12 – Upload a file.

Figure 12 – Upload a file

You will eventually be asked if you want to reboot the EdgeRouter. Press the “Reboot” button. You will then be asked to confirm the reboot, click on the “Yes, I’m sure” button. See Figure 13 – Upgrade Complete Dialog.

The router will inform you that it is rebooting. See Figure 14 – Reboot Process.

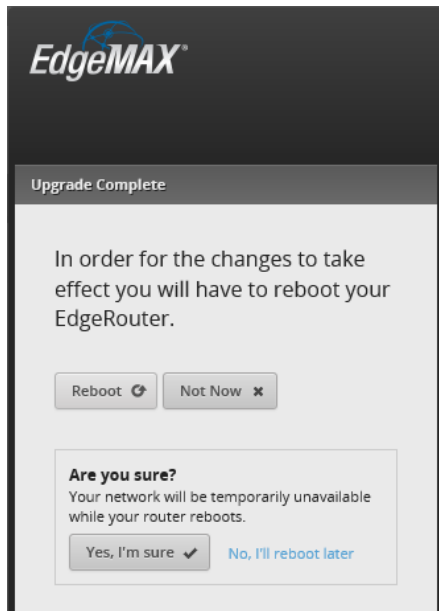

Figure 13 – Upgrade Complete Dialog

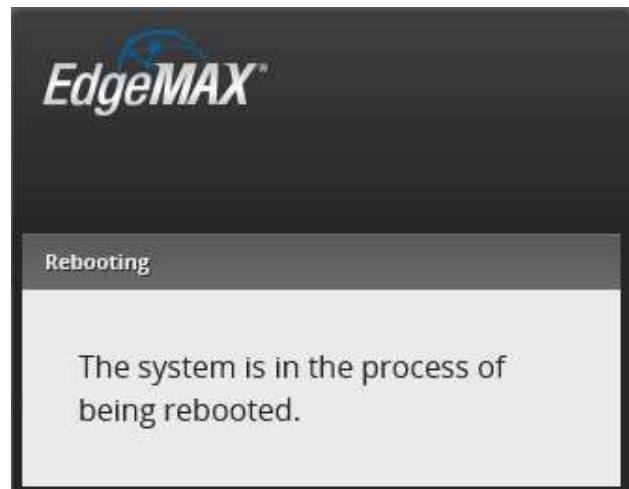

Figure 14 – Reboot Process

While the EdgeRouter is rebooting, the web page will present you with a Lost Connection Dialog. See Figure 15 – Lost Connection Dialog.

Eventually, when the EdgeRouter has fully re-booted, the presented dialog will change to Figure 16 – Timed-Out Dialog. This is a nice touch of web programming from Ubiquiti, so you can easily know when re-booting has completed.

Press the Reload button.

Figure 15 – Lost Connection Dialog

Figure 16 – Timed-Out Dialog

You will be asked to login; please enter the username and password into the dialog. The default username is “ubnt” and the default password is “ubnt”. See Figure 17 – Login Dialog.

Figure 17 – Login Dialog

You should be presented with a dialog box stating that the “Router is in default config. Do you want to start with the Basic Setup wizard?” Answer “no.” Reference Figure 7 – Basic Setup Question.

You will (again) land at the Dashboard screen. Reference Figure 8 – Initial Dashboard Screen. Check the upper left of the screen and verify that you are presented with the version of code that you just downloaded. See Figure 18 – Example EdgeRouter Version.

Figure 18 – Example EdgeRouter Version

If you get your EdgeRouter messed up, you might need to factory reset it. Here are some link(s):

<https://help.ubnt.com/hc/en-us/articles/205202620-EdgeRouter-Reset-to-Factory-Defaults>

<https://help.ubnt.com/hc/en-us/articles/360002231073-EdgeRouter-How-to-Use-SSH-Recovery->

<https://community.ubnt.com/t5/EdgeRouter/ERX-ERX-SFP-System-Recovery/td-p/2056921>

10. About Using Two or More Ubiquiti Access Points

Some people have wanted to connect two (or more) Ubiquiti Access Points (UAPs) to their ER-X to provide more / wider WiFi coverage. The following ideas should work, but I have only tested Methods 1 and 4. Therefore, the following directions are approximate.

Method 1: Connect an 802.1Q capable switch to eth4, and then connect your access points to this switch. Some switches will need to be specifically configured to pass VLAN 6 and VLAN 7 data. The HomeNet / trunk / 192.168.3.X data will probably not need to be specifically configured.

Netgear and TP-Link make some inexpensive switches which should work. Some models are:

Netgear: GS105Ev2 (5 port) and GS108Tv2 (8 port)

TP-Link: TL-SG105E (5 port) and TL-SG108E (8 port)

TP-Link: TL-SG105 Ver 2.1 (5 port) UN-managed switch

Note that these switches are typically configured via a Microsoft Windows (only) program. Some of these switches now have an embedded web server in them for configuration. These web servers may be incomplete in implementing the needed configuration commands. I have now tested Method 1 with a TP-LINK TL-SG105EV2 managed switch and separately tested with a TL-SG105 Ver 2.1 Un-managed switch. I believe you will need a hardware version of V2 or above to operate correctly. For configuration details, reference Appendix A. I suggest that you don't perform these operations until you are finished with the rest of this document.

Method 2: Plug your one or two additional UAP(s) directly into the ER-X router. You will need to forego the Wired IOT Network and/or the Wired Separate Network. This would alternately configure the HomeNet on ports 1,3,4 or 2,3,4 or 1,2,3,4. This saves the cost of needing to purchase an additional 802.1Q capable switch, but delivers fewer features.

To include port 1 in HomeNet, instead CHECK the "One LAN" box in section 11 / Figure 21. You will need to figure out the additional associated changes which are later in this document.

To include port 2 in HomeNet, DON'T follow sections 18, 19, 24. You will need to figure out the additional associated changes which are later in this document.

Method 3: Use an ER-X SFP instead of a "plain" ER-X. This model router has an extra SFP port on it. You will also need an appropriate SFP adapter to use the extra port. Using this Method, just about doubles the cost of this project. I hear that most "copper" SFP modules do not auto-negotiate link speeds.

Method 4: Configure the additional Ubiquiti access points to WiFi mesh / chain to the original UAP.

[Update: it appears that multi-hop support has been added in later versions of AP firmware.]

Reference the following:

<https://help.ubnt.com/hc/en-us/articles/115002262328>

Ubiquiti also makes specific equipment for multi-hop deployments. Some of that equipment is rated for outdoor use. Note that using mesh equipment / modes will likely decrease your wireless bandwidth by at-least half. If you can, wire each Access Point back to your EdgeRouter.

General:

Except for method 4, Each UAP should be Ethernet-wired and they should all be configured the same, except that each UAP should be configured using different and non-overlapping WiFi channels. For the U.S., the non-overlapping 2.4GHz channels are: 1, 6, 11.

I would look at <https://community.ubnt.com/t5/UniFi-Wireless/bd-p/UniFi> for more info on UAP setup.

Remember that Ubiquiti Access Points (UAPs) are capable of supporting four SSIDs, only three were used in the guide. You have another WiFi SSID available for use.

See also section 13, the “VLAN References” portion of section 27, and more information in Appendix A.

Ethernet data can be sent over cable TV coax by using “Multimedia over Coax Alliance (MOCA)” adapters. These can be used for general purpose Ethernet drops or for wiring / placing UAPs within a house. These are discussed in Appendix B.

11. EdgeRouter Wizard

Press the “Wizards” button, which is located in the upper-right portion of the Dashboard screen. See Figure 19 – Wizards Button.

Figure 19 – Wizards Button

You will see the following (portion shown) of the Wizard Screen. See Figure 20 – Wizard Screen Portion.

Figure 20 – Wizard Screen Portion

Note that there are various Wizards available, which can turn the EdgeRouter into a network switch, or perform load balancing between two WAN interfaces. Most people will probably be interested in a “standard” setup, as described in this guide, which is “WAN+2LAN2”.

Choose “WAN+2LAN2”. See Figure 21 – Wan+2LAN2 Dialog. You will need to expand / open sections, and make the following selections:

In the “Internet Port” section:

Port:	eth0	
Internet CT:	DHCP	
VLAN:	UN-Checked	(Internet Connection is on VLAN)
Firewall:	CHECKED	(Enable the default firewall)
DHCv6 PD:	UN-Checked	(Enable DHCv6 Prefix Delegation)

In the next (unlabeled) section:

One LAN:	UN-Checked	(Only use one LAN)
----------	------------	--------------------

In the “(Optional) Secondary LAN port (eth1)” section:

Address:	192.168.4.1 / 255.255.255.0	
DHCP:	CHECKED	(Enable the DHCP server)

In the “LAN ports (eth2, eth3, eth4)” section:

Address:	192.168.3.1 / 255.255.255.0	
DHCP:	CHECKED	(Enable the DHCP server)

If your internet provider uses something other than DHCP (i.e. IP address provided from your cable / dsl modem), you will need to select “Static IP” or “PPPoE”, and then configure those settings accordingly.

Unchecking the “Only use one LAN” selection informs the Wizard to un-bundle eth1 from eth2-4, allowing for the provision of a separate Network. I used this eth1 Network for Wired IOT devices.

It is important that “Enable the default firewall” is CHECKED. The entire security of this router depends upon this setting.

Under the “User setup” section, either change the default password to something secure / unique or “Create new admin user” with a secure / unique password. If you “Create new admin user”, you will need to also return to this dialog and delete the default “ubnt” login. You will need to remember your login credentials.

[Note you **REALLY** should make a new and unique admin-user login-name and then delete the default ‘ubnt’ login-name for security.]

Press “Apply” at the bottom of the screen.

Use this wizard to set up basic Internet connectivity and to customize local network settings

▼ Internet port (eth0 or eth4)

Connect eth0 or eth4 to your Internet connection, for example, the cable modem or DSL modem, and select the connection type.

Port

Internet connection type ☒ DHCP
Automatically obtain network settings from the Internet Service Provider

☐ Static IP

☐ PPPoE

VLAN ☐ Internet connection is on VLAN

Firewall ☒ Enable the default firewall

DHCPv6 PD ☐ Enable DHCPv6 Prefix Delegation

One LAN ☐ Only use one LAN

▼ (Optional) Secondary LAN port (eth1)

Optionally, connect eth1 to your secondary local network.

Address /

DHCP ☒ Enable the DHCP server

▼ LAN ports (eth2, eth3 and eth4)

Connect the LAN ports to your devices or/and a switch that connects to additional devices.

Address x /

DHCP ☒ Enable the DHCP server

▼ User setup

Setup user and password for the new router config.

User ☒ Use default user
Use default user and password for the router. Password could be customized optionally.

User

Password

Confirm Password

☐ Create new admin user

☐ Keep existing users

Figure 21 – Wan+2LAN2 Dialog

After Applying, you will be presented with Figure 22 – Replace Configuration. Please study what it says. Press “Apply Changes.”

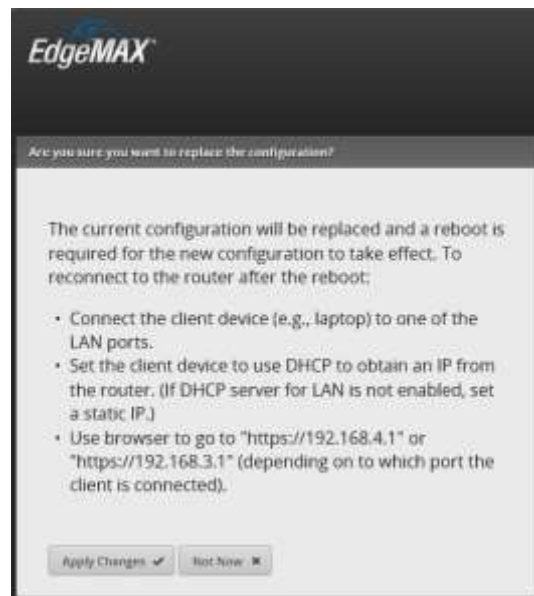

Figure 22 – Replace Configuration

Press Reboot, then confirm the reboot, by pressing the “Yes, I’m sure” button. See Figure 23 – Reboot into New Configuration.

Figure 23 – Reboot into New Configuration

The EdgeRouter will inform you that it is rebooting. Reference Figure 14 – Reboot Process. The EdgeRouter takes several minutes to reboot.

Disconnect your setup computer’s Ethernet jack from the EdgeRouter’s eth0 connection. Re-configure your setup computer’s Ethernet port back to using DHCP. Again, there are many tutorials available on the internet that show how to configure a computer’s Ethernet jack to use DHCP. Reference section 7 - Initial EdgeRouter Hardware Setup, but instead choose “Obtain an IP address automatically.” Also reference Figure 3 – Windows 10 Ethernet Address Setup.

12. EdgeRouter Re-Connection

Ensure that your existing router's LAN ports are not using any of the addresses utilized by the EdgeRouter, i.e. not using 192.168.3.0 through 192.168.7.255. Reference section "4 - EdgeRouter IP Address Use." Connect the EdgeRouter's eth0 port into your existing router's LAN port with a standard Ethernet cable. Connect your setup computer's Ethernet port (now re-configured for DHCP) into the EdgeRouter's eth3 port. See Figure 2 - EdgeRouter Configuration Setup.

Open a web browser on your computer and enter <https://192.168.3.1> into the address field.

Acknowledge the browser's security warning, Reference Figure 5 – IE Security Certificate Example.

Login to your EdgeRouter, as shown in Figure 17 – Login Dialog.

You will be presented with the Dashboard Screen. See Figure 24 – Dashboard Screen.

Figure 24 – Dashboard Screen

13. Network Naming

Setting up the EdgeRouter, per this guide, provides for several separate Networks. In this guide, I try to use the word “Network” (capitalized) for these. Each Network has a unique IP address range / subnet. See Table 1 - Table of Networks.

Network Name	IP Address Range	Interface	VLAN	Address Group Term
Internet	DHCP	eth0	No	-
Home Network	192.168.3.X	eth3, eth4	No	HOME_GROUP
Wired IOT Network	192.168.4.X	eth1	No	WIRED_IOT_GROUP
Wired Separate Network	192.168.5.X	eth2	No	WIRED_SEPARATE_GROUP
Wi-Fi Guest Network	192.168.6.X	-	6	WIFI_GUEST_GROUP
Wi-Fi IOT Network	192.168.7.X	-	7	WIFI_IOT_GROUP

Table 1 - Table of Networks

Some of these Networks are on a Virtual LAN (VLAN). VLANs provide the ability for separate network data to be carried over shared Ethernet cables. Data that is “tagged” as belonging to a specific VLAN cannot interact with either non-VLAN data (trunk data) or with data from any different VLAN.

When VLANs are used, all devices involved with this data need to be VLAN aware. Any network switches carrying VLAN traffic will need to be IEEE 802.1Q capable, e.g. a Level 2 managed switch.

Note that the only VLAN traffic shown in Table 1 - Table of Networks is involved with the Wi-Fi Guest Network and the Wi-Fi IOT Network. The Ubiquiti AP-AC-LR access point is VLAN aware. Eventually the Access Point will be plugged directly into the EdgeRouter’s eth4 interface, so VLAN data will be able to be carried between them. If you are going to deploy multiple Access Points, then the network switch attaching the Access Points to the EdgeRouter’s eth4 port MUST be IEEE 802.1Q capable.

This Wi-Fi VLAN data does NOT need to flow to devices on the Wired Home Network, therefore, the network switch attached to the EdgeRouter’s eth3 interface can be a (inexpensive) unmanaged switch.. Reference Figure 1 - Overview Diagram. If they are needed, the network switches attached to the EdgeRouter’s eth1 and/or eth2 interfaces can also be (inexpensive) unmanaged switches.

Each Network is also customizable to provide functionality and connectivity. The rest of this guide will provide sufficient details on that.

There are many VLAN references on the web. Here is one brief tutorial:

<http://www.microhowto.info/tutorials/802.1q.html>

More References:

<https://help.ubnt.com/hc/en-us/articles/204976664-EdgeRouter-Packets-Processing>

I was asked to add a reference for google config to this guide, so here it is:

<https://github.com/mjp66/Ubiquiti/issues/31>

14. EdgeRouter Command Line Interface (CLI)

In most of Ubiquiti's Edgerouter forum posts, steps to (re-)configure items are given as Command line Interface (CLI) commands. In fact, not very many GUI screenshots are used, and they are typically posted only by novices.

The following steps show how to open and use the built-in CLI interface. Click on the "CLI" button, in the upper-right screen. See Figure 25 – CLI Button.

Figure 25 – CLI Button

The initial CLI window will appear as a semi-transparent overlay. See Figure 26 – Initial CLI Window.

Figure 26 – Initial CLI Window

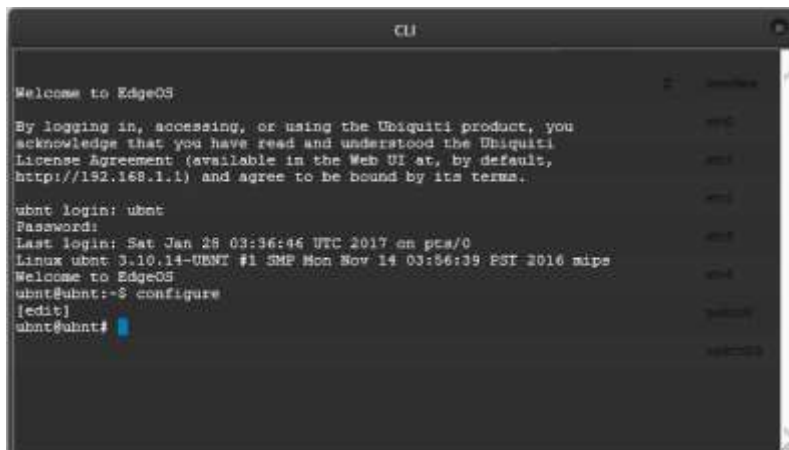

Login to this window, using your EdgeRouter's user name and password. You will now be presented with a command prompt. See Figure 27 – Logged-In CLI Window.

Figure 27 – Logged-In CLI Window

CLI commands are typically divided into configuration commands and non-configuration commands. The CLI interface will accept only configuration commands when in configuration mode. Type the "configuration" command to enter configuration mode. The "exit" command is used to leave configuration mode and return to normal (non-configuration) mode.

If you enter the “configure” command, the CLI window’s prompt will now include “[edit]”. See Figure 28 – Configure CLI Window.

```
CLI

Welcome to EdgeOS

By logging in, accessing, or using the Ubiquiti product, you
acknowledge that you have read and understood the Ubiquiti
License Agreement (available in the Web UI at, by default,
http://192.168.1.1) and agree to be bound by its terms.

Linux ubnt 3.10.14-UBUNTU #1 SMP Mon Nov 14 03:56:39 PST 2016 mips
Welcome to EdgeOS
ubnt@ubnt:~$ configure
[edit]
ubnt@ubnt#
```

Figure 28 – Configure CLI Window

Many times when doing a commit and/or a save command, the page will need to be refreshed. A refresh dialog box will pop-up on the screen. See Figure 29 – Configuration Change. Press the “Refresh” button.

Figure 29 – Configuration Change

You can also use a popular Windows program, called putty.exe, to Secure Shell (SSH) into the EdgeRouter, and then issue CLI commands. Linux users should already be familiar with how to use SSH.

Here are some CLI references:

- https://dl.ubnt.com/guides/edgemax/EdgeSwitch_CLI_Command_Reference_UG.pdf
- <https://community.ubnt.com/t5/EdgeMAX/EdgeOS-CLI-Primer-part-1/td-p/285388>
- https://community.ubnt.com/t5/EdgeMAX-CLI-Basics-Knowledge/tkb-p/CLI_Basics@tkb

15. EdgeRouter Config Tree

There is a neat and alternate way to configure the EdgeRouter. Near the top of the screen is a “Config Tree” button. See Figure 30 – Config Tree Button.

Figure 30 – Config Tree Button

When you press it, the “Configuration” Tree window will appear. See Figure 31 – Config Tree Initial Screen.

Figure 31 – Config Tree Initial Screen

Using the config tree is an alternate method (for some items) to using the Command Line Interface (CLI).

16. My Command Line Trouble

When I was experimenting with dnsmasq, many internet resources simply gave CLI commands to enable this feature. When I tried some of these commands, my EdgeRouter had problems. I no longer remember what the exact problem was, but I noticed that sometimes when using the Config Tree, multiple commands were issued.

See Figure 32 – Example of Multiple Config Tree Commands.

Figure 32 – Example of Multiple Config Tree Commands

17. EdgeRouter Backup / Configuration Files

When EdgeRouters are described in most internet forums, their configuration parameters are usually described (in text) by a standard file format. Eventually, you will need to be fluent in reading these files and translating that data into actions taken in the Command Line Interface (CLI), the Config Tree or the GUI.

You can find this configuration data within the config.boot file that is inside of the backup file generated from the system window. The file that is generated is typically named edgeos_ubnt_<date>.tar.gz, with <date> replaced by numbers representing today's date.

To generate a backup file, first press the System button, as shown in Figure 9 – System Button. You will be presented with the System screen, as shown in Figure 10 – System Pop-up Screen.

Find and press the “Download” button under the Configuration Management & Device Management section. See Figure 33 – Back Up Config Download Button.

Figure 33 – Back Up Config Download Button

You will be presented with a dialog of where to (open or) save your backup file. This dialog is browser specific. Save your file to a directory of your choice on your setup computer. This file will be needed if you ever need to reload your EdgeRouter. You may want to do this frequently, when setting up this device.

Another way to obtain a relevant portion of this file is to issue one of the following commands into the Command Line Interface (CLI) window. For information about the CLI, reference section “14 - EdgeRouter Command Line Interface (CLI)”.

Two different / similar normal-mode CLI command for acquiring the system configuration are:

```
cat /config/config.boot  
show configuration | no-more
```

I will show as many portions of this config data as possible throughout this guide. One goal of this guide is to teach users enough about this EdgeRouter that they are comfortable reading and understanding the backup files.

You would do well to save / keep multiple backup files, while you are working through this guide.

Link(s):

<https://help.ubnt.com/hc/en-us/articles/360002535514>

18. Remove eth2 from the EdgeRouter's Internal Switch

In this optional step, we will manually un-bundle the eth2 interface from the EdgeRouter's internal switch chip to provide for the Wired Separate Network on the eth2 interface. Un-bundling this interface from switch0 enables a separate physical network. An additional network could be achieved by adding a logical VLAN, but we are choosing to implement an additional network on the physical eth2 port. The switch chip will remain enabled for eth3 and eth4 interfaces. Later, we will assign an IP address range to this port, setup DHCP to provide IP addresses to eth2 connected devices, and create firewall rules that will keep this Network isolated from the other Networks. If you choose to not implement the Wired Separate Network, there are other associated steps you will not perform.

Press the Dashboard Button. See Figure 34 – Dashboard Button.

Figure 34 – Dashboard Button

On the right side of the Dashboard screen, select switch0's "Actions" button. See Figure 35 – switch0's Action Button.

Figure 35 – switch0's Action Button

A sub-menu will appear, Select "Config" from the menu items. See Figure 36 – switch0 Actions Config.

Figure 36 – switch0 Actions Config

You will be presented with the configuration dialog for switch0. See Figure 37 – switch0 Configuration.

Select the VLAN tab. Under the section labeled "Switch Ports", UN-CHECK eth2. See Figure 38 – switch0 Switch Ports.

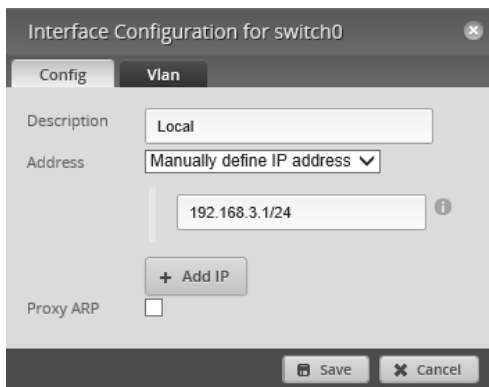

Figure 37 – switch0 Configuration

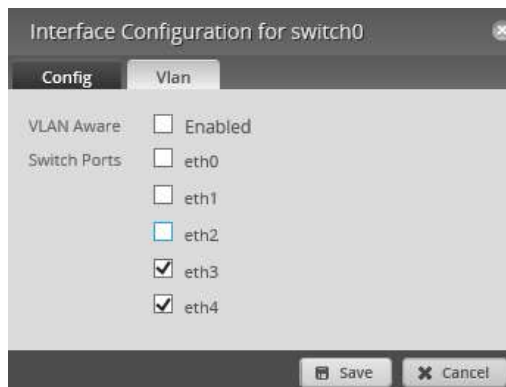

Figure 38 – switch0 Switch Ports

Press "Save". While the EdgeRouter is completing this task, a busy indicator will spin, in the upper right corner of the dialog. See Figure 39 – Busy Indicator. Wait for the Busy Indicator to finish spinning. It will be replaced by a Green checkmark when the task is completed. See Figure 40 – Finished Checkmark.

Figure 39 – Busy Indicator

Figure 40 – Finished Checkmark

19. Configure EdgeRouter's eth2 IP Addresses

Now that the eth2 interface has been un-bundled, we need to allocate a new IP address range to this interface. On the right side of the Dashboard screen select eth2's "Actions" button. See Figure 41 – eth2's Actions Button.

Figure 41 – eth2's Actions Button

A sub-menu will appear, See Figure 42 – Interface Actions.

Figure 42 – Interface Actions

Select "Config". You will be presented with Figure 43 – Configuration for eth2 Dialog.

Figure 43 – Configuration for eth2 Dialog

Under the Address selection, choose "Manually define IP address", and enter "192.168.5.1/24" into the address field. See Figure 44 – eth2 Address Dialog.

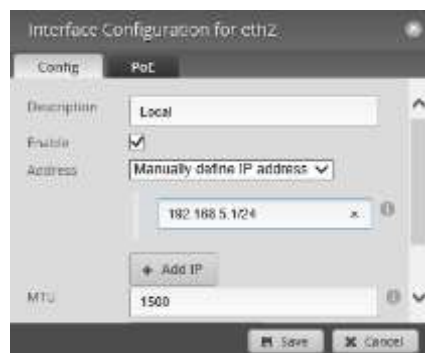

Figure 44 – eth2 Address Dialog

Click the Save button.

20. About DNS settings

I seem to have spent more time investigating DNS settings for the EdgeRouter than in learning firewall rules.

Within this guide, I am now using Quad9 DNS addresses for the Home Network and Level3 DNS addresses for the Separate Network. I am also using / forcing OpenDNS DNS addresses for the IOT and Guest Networks. Change any or all of these addresses to the DNS provider(s) / resolver(s) addresses of your choice.

Some people are reporting that Quad9 is slower, See Section 75 - Adblocking and Blacklisting as a possible security alternative.

Steve Gibson has a web page that can help you characterize various DNS providers. Since it runs from your computer, the results are localized to your connection / ISP. Until the EdgeRouter is fully setup, you might want to run this from a computer that is currently wired outside of the EdgeRouter. This is shown as “Existing LAN” in Figure 2 - EdgeRouter Configuration Setup. The page is at:

<https://www.grc.com/dns/benchmark.htm>

Steve Gibson has another web page that tests the “spoofability” (security) of DNS resolvers. It is at:

<https://www.grc.com/dns/dns.htm>

Here are some alternate DNS resolvers, and additional DNS information pages:

https://en.wikipedia.org/wiki/List_of_managed_DNS_providers

<https://dns.norton.com/configureRouter.html>,

<https://dns.norton.com/faq.html>

<https://community.ubnt.com/t5/EdgeMAX/Traffic-Analysis-host-name-resolution/m-p/1774017#M141121>

<https://loganmarchione.com/2016/08/edgerouter-lite-dnsmasq-setup/>

<https://community.ubnt.com/t5/EdgeRouter/DNS-Forwarding-Name-Servers/td-p/1117142>

For more information on Quad9, see Security Now Podcast #638 at <https://www.grc.com/securitynow.htm>

Dns Crash Note:

I've experienced some infrequent router crashes. These crashes seem to involve dns and last about five minutes. During this time your router is ineffective. I've posted about this issue on the Ubiquiti forums and have not found a solution. Reference <https://community.ubnt.com/t5/EdgeRouter/ER-X-Dns-Forwarding-Not-Acting-Configured-Correctly/td-p/2301019>

You may not experience these crashes, or if you do, you may choose to just live with these symptoms. One workaround seems to be not using the ER-X's dnsmasq service as your Home Network resolver. If you don't use dnsmasq, you will lose the benefits of local caching and of being able to access Network devices by their local name. The workaround involves changing "DNS 1" and "DNS 2" to alternate (external) dns resolver IP addresses for LAN2 (the Home Network.) If you want to work around this issue, you should probably perform these changes when performing the actions in section 29 - Set Domain Names for Networks, remembering to additionally change LAN2.

[Update: I have not seen these in quite some time; I think newer ER-X firmware may have fixed these.]

21. dnsmasq

There are two different DNS packages available within the EdgeRouter. They are ISC (default) and dnsmasq. Dnsmasq was incomplete as of firmware 1.9.0 and had an additional bug added in firmware 1.9.1, I think it was re-broken and fixed during the hoxfixes of 1.9.7. Enabling dnsmasq is optional.

To enable dnsmasq, enter the Config Tree. Reference section “15 - EdgeRouter Config Tree.” Select and open up the following config tree sub-menu items from the configuration screen:

```
service
dhcp-server
```

You should see some DHCP settings, including use-dnsmasq and hostfile-update. (Note, your screen will still show “disable”). See Figure 45 – use-dnsmasq.

Figure 45 – use-dnsmasq

Type “enable” in the use-dnsmasq box and in the hostfile-update box. Then press the “Preview” button. See Figure 46 – commit-dnsmasq.

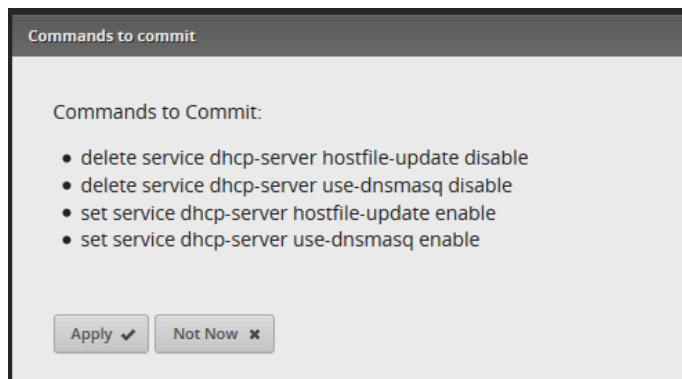

Figure 46 – commit-dnsmasq

Press “Apply.” You should see the message “The configuration has been applied successfully”, in green, near the bottom of the screen.

With local hostname resolution, you can lookup different devices / PCs on your Network by just referencing the name of the device / PC. For instance, you can look up a second PC on your Home Network from another PC on your Home Network by referencing its name, i.e. by typing (example) "ping DifferentPcName" or by entering "<http://DifferentPcName>" (if it is a web server), etc....

To allow local hostname resolution, perform the following changes. Drop into the Command Line Interface (CLI) and issue the following commands:

```
configure
set system name-server 127.0.0.1
set service dns forwarding listen-on switch0
set system domain-name home.local
commit
save
exit
```

You should see a yellow "The configuration has been changed and is in the process of being committed" message. See Figure 47 – The Configuration has been changed message

Figure 47 – The Configuration has been changed message

References:

<https://help.ubnt.com/hc/en-us/articles/115002673188-EdgeRouter-Using-dnsmasq-for-DHCP-Server>

<https://help.ubnt.com/hc/en-us/articles/115010913367-EdgeRouter-DNS-Forwarding-Explanation-Setup-Options>

Additional:

<https://loganmarchione.com/2016/08/edgerouter-lite-dnsmasq-setup/>

22. System DNS Settings

This step instructs the EdgeRouter to use specific DNS servers to resolve web URLs into IP addresses. These DNS servers are specified under the System widow. The Guest and IOT Networks set up via this guide use different DNS servers, as overridden by their specific DHCP servers.

Press the “System” button. Reference Figure 9 – System Button.

On the system window, find the Name Server Box. See Figure 48 – Initial System Name Server.

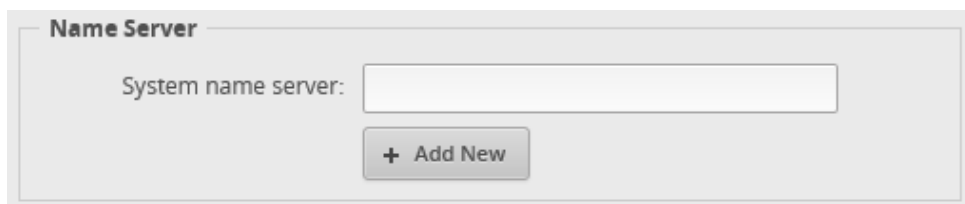

Figure 48 – Initial System Name Server

Fill in the System name server field with your primary DNS server address. I recently switched over to using a Quad9 resolver which has a primary address of:
9.9.9.9

Most DNS systems have multiple resolver addresses, in case of failure. The Quad9 infrastructure recently added a secondary resolver address, so press the “+ Add New” button and enter your secondary DNS server address. Quad9’s secondary address is 149.112.112.112

Reference: <https://github.com/mjp66/Ubiquiti/issues/13> and <https://www.quad9.net/faq>

See Figure 49 – Example System DNS Entries.

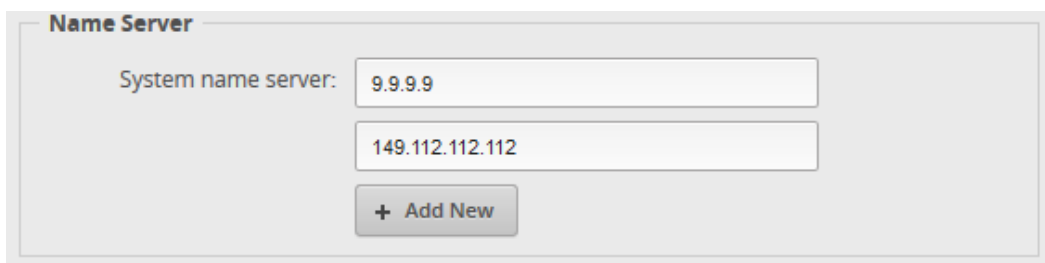

Figure 49 – Example System DNS Entries

Press the Save button near the bottom of the system page. See Figure 50 – System Save Button.

Figure 50 – System Save Button

23. Remove ISP Provided DNS Resolvers

I don't want to depend upon the DNS servers that are provided by my dsl / cable modem. The specific DNS resolver addresses are specified as part the DHCP data, which is given to the EdgeRouter's eth0 WAN port from the dsl / cable modem. Performing the commands in this section is optional / up to you.

These ISP DNS servers are probably OK, but I don't trust the security of phone-company/cable-company provided modems. Consumer modems are typically full of unpatched security holes, and many have programmed backdoors in them. Commercial modems bulk produced by the lowest bidder and externally controlled by large, uncaring companies have got to be even worse.

In particular, there are DNS changer worms, which attack consumer / commercial routers and change their DNS resolver settings. The way to help circumvent this problem is to instruct the EdgeRouter to ignore the DHCP provided DNS resolver address from your commercial router / ISP.

Since the DNS changer worm could attack an EdgeRouter, remember to change the EdgeRouter's default password to something strong. You don't want to end up like these people:

<https://www.routersecurity.org/bugs.php>,

-> January 2018, -> MikroTik and Ubiquiti Routers defaced due to default passwords

To see the DNS resolvers being used by the EdgeRouter, issue the CLI command:

show dns forwarding nameservers.

(For information on the CLI, reference section "14 - EdgeRouter Command Line Interface (CLI)")

The following text shows theQuad9 resolver that was entered into the system page, and an ISP-provided resolver, delivered via my existing / upstream router, which has an address of 192.168.2.1:

```
-----
Nameservers configured for DNS forwarding
-----
192.168.2.1 available via 'dhcp eth0'
9.9.9.9 available via 'system'
149.112.112.112 available via 'system'
```

To remove the ISP-provided nameservers, drop into the Command Line Interface (CLI) and issue the following commands:

```
configure
set service dns forwarding system
commit
save
exit
```

To see if this worked, re-issue the CLI command "show dns forwarding nameservers". This is what I got:

```
-----
Nameservers configured for DNS forwarding
-----
9.9.9.9 available via 'optionally configured'
149.112.112.112 available via 'system'
-----
Nameservers NOT configured for DNS forwarding
-----
192.168.2.1 available via 'dhcp eth0'
```

Reference <https://community.ubnt.com/t5/EdgeMAX/Change-WAN-DNS-Server/td-p/977885>

According to <https://github.com/mjp66/Ubiquiti/issues/11>, you would restore using your ISP's resolvers with the following commands:

```
configure
delete service dns forwarding system
set service dns forwarding listen-on eth0
commit
save
exit
```

24. Configure EdgeRouter's eth2 DHCP Server

Now that eth2 has been un-bundled, and has a unique IP subnet assigned to it, we need to provide a DHCP server on this port. Near the top of the screen select the “Services” button. See Figure 51 – Services Button.

Figure 51 – Services Button

Ensure that the “DHCP Server” tab is selected. See Figure 52 – DHCP Server Screen.

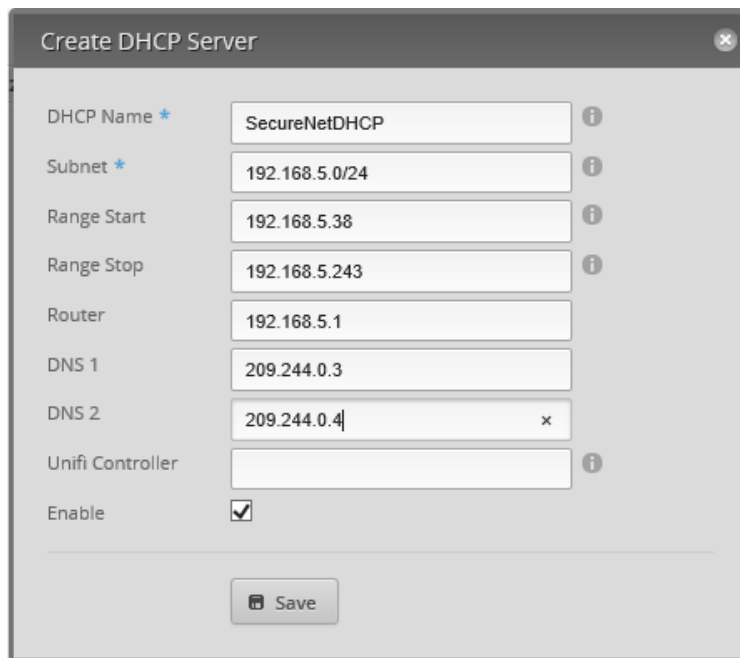

Figure 52 – DHCP Server Screen

Note that I am using Level 3 DNS resolver addresses for DNS1 and DNS2 (below). You can change these to providers of your choice. If you change them here, you will also need to manually modify some firewall / NAT rules, presented later within this guide.

Click on the “+ Add DHCP Server” button. You will be presented with a Create DHCP Server dialog. See Figure 53 – Create eth2 DHCP Server Screen. Fill in the form as follows:

DHCP Name:	SecureNetDHCP
Subnet:	192.168.5.0/24
Range Start:	192.168.5.38
Range Stop:	192.168.5.243
Router:	192.168.5.1
DNS 1:	209.244.0.3
DNS 2:	209.244.0.4
Enable:	CHECKED

Click “Save.”

The image shows a 'Create DHCP Server' window with the following fields and values:

Field	Value
DHCP Name *	SecureNetDHCP
Subnet *	192.168.5.0/24
Range Start	192.168.5.38
Range Stop	192.168.5.243
Router	192.168.5.1
DNS 1	209.244.0.3
DNS 2	209.244.0.4
Unifi Controller	
Enable	<input checked="" type="checkbox"/>

At the bottom is a 'Save' button.

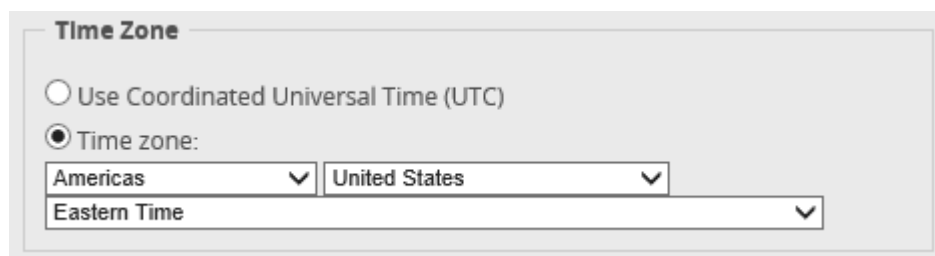

Figure 53 – Create eth2 DHCP Server Screen

I used the same range start and range stop values (38 and 243) that the wan+2lan2 wizard used within the DHCP servers for LAN1 and LAN2.

For some reason, the Ubiquiti GUI programmers seem to have forgotten to include the setting of “authoritative enable” and “domain” from this GUI interface. Setting of those will come later.

25. Configure EdgeRouter’s Time Zone

Near the bottom of the screen select the “System” button. Reference Figure 9 – System Button. Find the section titled “Time Zone” and configure the data in these fields according to the time zone you are in, unless you want your router to remain in UTC. See Figure 54 – Time Zone.

The image shows a 'Time Zone' configuration window with the following options:

- ☐ Use Coordinated Universal Time (UTC)
- ☒ Time zone:
 - Americas (dropdown)
 - United States (dropdown)
 - Eastern Time (dropdown)

Figure 54 – Time Zone

Press the Save button, Reference Figure 50 – System Save Button.

26. DNS Forwarding

Press the “Services” button, near the top right of the window. Reference Figure 51 – Services Button. Ensure that the “DNS” Tab is selected. See Figure 55 – DNS Tab.

Figure 55 – DNS Tab

I changed my cache size to 400. We want to remove eth1 from this list. Change the first item (which can't be removed) to “switch0”. Then press the “- Remove” button to the right of the second item. The result should look like Figure 56 – Remove eth1 from DNS. Press “Save.”

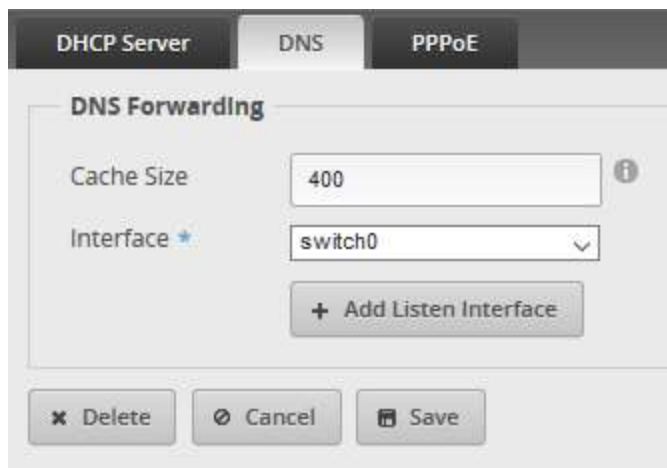

Figure 56 – Remove eth1 from DNS Forwarding

27. Add VLAN Networks to the EdgeRouter

The Ubiquiti AC-AP-LR Wi-Fi access point can manage up to four separate Networks / SSIDs, by using VLANs. VLANs allow separated IP data to flow over one Ethernet cable, without the data being mixed together. This section will create two new Networks using VLANs.

Press the Dashboard button near the top of the Screen. Reference Figure 34 – Dashboard Button. On the upper left side of the Dashboard screen select the Add Interface button. See Figure 57 – Add Interface Button

Figure 57 – Add Interface Button

The Add Interface menu will appear. Select “Add VLAN”. See Figure 58 – Add Interface Menu

Figure 58 – Add Interface Menu

You will be presented with the “Create New VLAN” dialog. Fill in the information as follows:

VLAN ID:	6
Interface:	switch0
Description:	“Wifi Guest Net”
MTU:	1500
Address:	Manually define IP address 192.168.6.1/24

The AC-AP-LR access point will eventually be connected to the eth4 interface. The eth3 and eth4 interfaces are internally using the switch0 chip. Therefore, this VLAN needs to be attached to switch0, not to eth3 or to eth4. See Figure 59 – Create New VLAN Example. Press the “Save” button.

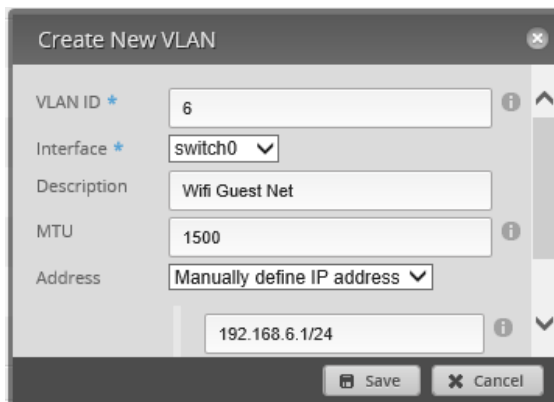

A dialog box titled "Create New VLAN" with a close button (X) in the top right corner. It contains several input fields: "VLAN ID" with the value "6", "Interface" with a dropdown menu showing "switch0", "Description" with the text "Wifi Guest Net", "MTU" with the value "1500", and "Address" with a dropdown menu showing "Manually define IP address" and a text field below it containing "192.168.6.1/24". At the bottom right, there are "Save" and "Cancel" buttons.

Figure 59 – Create New VLAN Example

Repeat these steps for adding a VLAN the Wi-Fi IOT Network. Fill in the information as follows:

VLAN ID: 7
Interface: switch0
Description: "Wifi Iot Net"
MTU: 1500
Address: Manually define IP address
192.168.7.1/24

There are the relevant sections from the backup file:

```
vif 6 {  
    address 192.168.6.1/24  
    description "Wifi Guest Net"  
    mtu 1500  
}  
vif 7 {  
    address 192.168.7.1/24  
    description "Wifi Iot Net"  
    mtu 1500  
}
```

Here is a link discussing using VLANs and managed switches to reduce the number of network cables in a home:

<https://community.ubnt.com/t5/EdgeMAX/Need-recommendation-on-tweaking-config-to-support-some-VLAN/td-p/2155404>

When originally writing this guide, I was not able to figure out how to combine the Wired IOT Network (as 192.168.4.X) and the Wi-Fi IOT Network (as 192.168.7.X) as a single Network / Subnet.

I have now tried a method to coalesce the Wired IOT Network and the WiFi IOT Network. Reference section 78 - Coalescing the Wired Iot and Wifi Iot Networks. If you are going to perform those optional steps, I'd wait until you reach that section, and not perform those steps now.

VLAN References:

<https://community.ubnt.com/t5/EdgeMAX-Stories/Do-people-use-VLANs-for-the-right-things-Pt-1/cns-p/1443246>

<https://community.ubnt.com/t5/EdgeMAX-Stories/Do-people-use-VLANs-for-the-right-things-Pt-2/cns-p/1443259>

<https://help.ubnt.com/hc/en-us/articles/205197630-EdgeSwitch-VLANs-and-Tagged-Untagged-Ports>

<https://help.ubnt.com/hc/en-us/articles/222183968-Intro-to-Networking-Introduction-to-Virtual-LANs-VLANs-and-Tagging>

28. Add DHCP Servers to the VLANs

Following the directions that are in the section titled “24 - Configure EdgeRouter’s eth2 DHCP Server”, add DHCP servers for the two VLANs that were just created. Note that I am using Open DNS servers for these networks. If you change them here, you will also need to manually modify some firewall / NAT rules, presented later within this guide.

The information for VLAN 6, is as follows:

DHCP Name:	WifiGuestDHCP
Subnet:	192.168.6.0/24
Range Start:	192.168.6.38
Range Stop:	192.168.6.243
Router:	192.168.6.1
DNS 1:	208.67.222.222
DNS 2:	208.67.220.220
Enable:	CHECKED

The information for VLAN 7, is as follows:

DHCP Name:	WifiIotDHCP
Subnet:	192.168.7.0/24
Range Start:	192.168.7.38
Range Stop:	192.168.7.243
Router:	192.168.7.1
DNS 1:	208.67.222.222
DNS 2:	208.67.220.220
Enable:	CHECKED

You should now have five DHCP servers.

29. Set Domain Names for Networks

Near the top of the screen select the “Services” button. Reference Figure 51 – Services Button. Ensure that the “DHCP Server” tab is selected. Reference Figure 52 – DHCP Server Screen

Find the LAN1 line, and follow it to the right side, to the line’s “Actions” button. Click the “Actions” button. You will be presented with a list of actions. Choose “View Details”. See Figure 60 – DHCP Actions.

Figure 60 – DHCP Actions

A dialog will open. See Figure 61 – DHCP Server Details Dialog.

A screenshot of a web dialog titled 'DHCP Server - LAN1'. It has three tabs: 'Leases', 'Static MAC/IP Mapping', and 'Details' (which is active). The 'Details' tab shows a summary of DHCP settings for LAN1. On the left, there's a table with 'Pool Size: 206', 'Leased: 0', 'Available: 206', and 'Static: 0'. To the right, it lists 'Subnet: 192.168.4.0/24', 'Range Start: 192.168.4.38', 'Range End: 192.168.4.243', 'Unifi Controller:', 'Router: 192.168.4.1', 'DNS 1: 192.168.4.1', 'DNS 2:', and 'Status: Enabled'. Below this, there are input fields for 'DHCP Name' (set to LAN1), 'Subnet' (192.168.4.0/24), 'Range Start' (192.168.4.38), 'Range Stop' (192.168.4.243), 'Router' (192.168.4.1), 'Unifi Controller', 'DNS 1' (192.168.4.1), 'DNS 2', 'Domain' (WiredotNet), 'Lease Time' (86400 seconds), and an 'Enable' checkbox (checked). At the bottom, there are 'Save' and 'Delete' buttons.

Figure 61 – DHCP Server Details Dialog

Fill-in the “Domain” field with:

WiredlotNet

and then click “Save.” When it is done updating, close the dialog.

Repeat these steps for the following DHCP Servers as show in Table 2 - Table of Domain Names (You have just done the first one of them):

DHCP Servers	Domain
LAN1	WiredlotNet
LAN2	HomeNet
SecureNetDHCP	SeparateNet
WiFiGuestDHCP	WifiGuestNet
WifiIOTDHCP	WifilotNet

Table 2 - Table of Domain Names

30. Modify EdgeRouter's eth1 DHCP Server

Select the "Services" button. Reference Figure 51 – Services Button.

Ensure that the "DHCP Server" tab is selected. Reference Figure 52 – DHCP Server Screen

Select the "Action" button to the right of the "LAN1" line. Reference Figure 60 – DHCP Actions.

Choose "View Details." Reference Figure 61 – DHCP Server Details Dialog.

Modify / enter the following information:

DNS 1: 208.67.222.222

DNS 2: 208.67.220.220

These DNS addresses have the equipment on the Wired lot Network use Open DNS resolvers. If different resolver addresses are used here, then some firewall rules (and probably group addresses) will also need to be modified. Covered later in this guide.

31. Make DHCP Servers “authoritative”

The EdgeRouter does not default any newly created DHCP servers to “authoritative.” This means that devices on the added Networks can take a long time to acquire an IP address. The Networks that were added by the Wizard (LAN1 and LAN2) are made authoritative by default.

Enter the Config Tree. Reference section “15 - EdgeRouter Config Tree.” Select and open up the following config tree sub-menu items from the configuration screen:

- service
- dhcp-server
- shared-network-name

Click on the DHCP server you want to configure; in this case, it is:

- SecureNetDHCP

You should see some DHCP settings, including authoritative. (Note, your screen will still show “disable”). See Figure 62 – Authoritative Example.

Figure 62 – Authoritative Example

Type “enable” in the authoritative box. Then press the “Preview” button. See Figure 63 – Authoritative Commit.

Figure 63 – Authoritative Commit

Press “Apply.” You should see the message “The configuration has been applied successfully”, in green, near the bottom of the screen.

Repeat these steps for the following Authoritative DHCP Servers as shown in Table 3 - Table of Authoritative DHCP Servers. (You have just done the first one of them):

Authoritative DHCP Servers
SecureNetDHCP
WiFiGuestDHCP
WifiotDHCP

Table 3 - Table of Authoritative DHCP Servers

Shown below are excerpts of three of the five DHCP sections from the backup file:

```
dhcp-server {
  disabled false
  hostfile-update disable
  shared-network-name LAN2 {
    authoritative enable
    subnet 192.168.3.0/24 {
      default-router 192.168.3.1
      dns-server 192.168.3.1
      domain-name HomeNet
      lease 86400
      start 192.168.3.38 {
        stop 192.168.3.243
      }
    }
  }
}
shared-network-name SecureNetDHCP {
  authoritative enable
  subnet 192.168.5.0/24 {
    default-router 192.168.5.1
    dns-server 209.244.0.3
    dns-server 209.244.0.4
    domain-name SeparateNet
    lease 86400
    start 192.168.5.38 {
      stop 192.168.5.243
    }
  }
}
shared-network-name WifiGuestDHCP {
  authoritative enable
  subnet 192.168.6.0/24 {
    default-router 192.168.6.1
    dns-server 208.67.222.222
    dns-server 208.67.220.220
    domain-name WifiGuestNet
    lease 86400
    start 192.168.6.38 {
      stop 192.168.6.243
    }
  }
}
}
use-dnsmasq enable
}
```

32. EdgeRouter Enable HW NAT Assist

Enabling “hwnat” turns on some features of a hardware switching chip that is within the EdgeRouter. This chip assists the EdgeRouter’s CPU with routing and NAT functionality, speeding up the operation of the EdgeRouter X. Without this hardware assist, routing of packets is relatively slow. Be warned; if Quality of Service (QoS) functionality is enabled, then this hwnat assist is internally / automatically disabled. You also don’t want to enable bridging, since bridging is implemented via the CPU of the EdgeRouter X and is also relatively slow.

With hwnat enabled, many people report 800 – 900Mbps throughput.

Open up the Configuration Tree. Reference section 15 - EdgeRouter Config Tree.

Select and open up the following config tree sub-menu items from the configuration screen:

- system
- offload

In the hwnat setting area, type:

- enable

then select the “Preview” button at the bottom of the page.

See Figure 64 – System Offload Hwnat Selection (Partial).

Figure 64 – System Offload Hwnat Selection (Partial)

The Edgerouter will preview what command(s) it will issue. See Figure 65 – Preview hwnat Config.

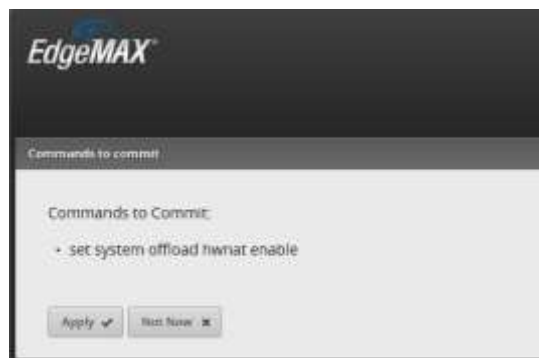

Figure 65 – Preview hwnat Config

Press “Apply.” The system will inform you that, “The configuration has been applied successfully”. See Figure 66 – hwnat Success

Figure 66 – hwnat Success

The above config-tree hwnat-enable could have been performed with the following CLI commands:

```
configure
set system offload hwnat enable
commit
save
exit
```

Compare the above command(s) with the command that the config-tree automatically issued in Figure 65 – Preview hwnat Config.

Remember that different models of EdgeRouters have different abilities / hardware assisting chips within them. Their commands may be different.

Reference: <https://help.ubnt.com/hc/en-us/articles/115006567467-EdgeRouter-Hardware-Offloading-Explained>

33. EdgeRouter ER-X Speed

The ER-X router seems capable of routing about 1Gbit/second aggregate/total.

The following article is well worth reading:

<http://kazoo.ga/re-visit-the-switch-in-edgerouter-x/>

Other performance references:

<https://community.ubnt.com/t5/EdgeMAX/Performance-of-EdgerouterX-vs-Edgerouter-Lite/td-p/1230924>

<https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-low-throughput-slow/td-p/1392229>

<https://community.ubnt.com/t5/EdgeMAX/ER-X-vs-ER-Lite-Head-to-Head-Speed-Results-on-Google-Fiber/td-p/1839844>

<https://www.stevejenkins.com/blog/2017/02/edgerouter-x-vs-edgerouter-lite-google-fiber-speed-tests/>

<https://community.ubnt.com/t5/EdgeMAX/Edgerouter-X-Fios-Gigabit-Won-t-go-over-500-Mbps/td-p/1910761>

34. EdgeRouter Enable Traffic Analysis

This step will enable the EdgeRouter to perform Deep Packet Inspection (DPI) / Traffic Analysis. If you have any speed issues with your ER-X, then this may need to stay off.

Press the “Traffic Analysis” button, near the top right of the screen. See Figure 67 – Traffic Analysis Button.

Figure 67 – Traffic Analysis Button

In the upper-right area of the traffic analysis screen, is an “Operational Status” selection. Select “Enabled.” See Figure 68 – Enable Operational Status

Figure 68 – Enable Operational Status

You will be presented with a confirmation dialog. See Figure 69 – Operational Status Confirmation.

Figure 69 – Operational Status Confirmation

Select “Yes.” The software will (for some reason) present you with an Alert. This is seen in the lower-left of the screen. See Figure 70 – Active Alert.

Figure 70 – Active Alert

Click on the “Alerts” button. You will be presented with the Alert message(s). See Figure 71 – Active Traffic Analysis Message.

Figure 71 – Active Traffic Analysis Message

To remove this Alert message, press the “Remove” button, located on the right side of the screen. See Figure 72 – Remove Alert Button

Figure 72 –Remove Alert Button

35. EdgeRouter Traffic Analysis

The Traffic Analysis performed by the EdgeRouter X is pretty neat. The following screen shot was taken when the Edgerouter was at this configuration step in generating this configuration document. The EdgeRouter had been booted for 41 minutes.

The only thing I had done, since I booted the “setup” computer, was to configure the EdgeRouter. I NEVER purposefully go to MSN.com, or to the Financial Times News. I only assume that those web lookups are from Microsoft’s Internet Explorer / Microsoft performing their Windows 10 monetization of their users, sometimes referred to as “spying.” See Figure 73 –Sample Traffic Analysis. This feature seems pretty neat at first. In real use there seems to be a lot of uncharacterized traffic under “Other.”

Figure 73 –Sample Traffic Analysis

Note that when HW NAT Assist is enabled, some traffic, which is handled by the internal switch chip, is not shown in traffic analysis. That is because Traffic Analysis is a CPU function, and the traffic that is being handled internally by the switch chip is not visible to the CPU. The configuration used in this guide has setup the switch0 chip to only move traffic between eth3 and eth4, which is the Home Net (Network).

36. EdgeRouter X/X-SFP bootloader bug

There is an initialization issue in the bootloader for the ER-X and ER-X-SFP models that causes all ports to act as a "switch" during a brief period of time when the router is booting up.

When this guide was written, Ubiquiti had still not updated their production line to incorporate the patched bootloader.

Reference <https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-acts-as-switch-during-boot/td-p/1393679>

37. EdgeRouter X/X-SFP check bootloader version

Check the version of your bootloader per:

<https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-X-SFP-check-bootloader-version/td-p/1617287>

Some postings may be missing the "s" in "firmwares".

38. EdgeMAX EdgeRouter X/X-SFP bootloader update

Note: Newer ER-X's supposedly have a newer bootloader and/or newer method of bootloader update. My EdgeRouters are older, so I have not tried this:

<https://help.ubnt.com/hc/en-us/articles/360009932554-EdgeRouter-How-to-Update-Bootloader>

Older bootloader updating text follows:

If your bootloader is not the newest, update your bootloader per:

<http://community.ubnt.com/t5/EdgeMAX-Updates-Blog/EdgeMAX-EdgeRouter-X-X-SFP-bootloader-update/ba-p/1472216>

<https://community.ubnt.com/t5/EdgeMAX-Updates-Blog/DEPRECATED-EdgeMAX-EdgeRouter-X-X-SFP-bootloader-update/ba-p/1472216>

It is much easier to update the EdgeRouter's bootloader when the EdgeRouter is connected to the internet.

You may need to prepend "sudo" to one for more of the following commands, to get this to work:

<https://community.ubnt.com/t5/EdgeMAX/ERX-bootloader-update/td-p/1892923>

<https://community.ubnt.com/t5/EdgeRouter/ER-X-bootloader-update-versions/td-p/2134544>

39. EdgeRouter Power Cycle Warning

Generally, you should use the reboot button that is located on the system screen to restart the EdgeRouter; don't simply remove power to the EdgeRouter, if you can help it.

Reference **TBD**

40. EdgeRouter UPnP

Don't enable UPnP. If you need to connect devices like an Xbox behind your EdgeRouter, then manually open / forward the firewall ports by hand. If you really want UPnP, I've got a slightly used D-Link router for sale, which probably has lots of holes already in its firewall. Just ask the Federal Trade Commission.

Reference **TBD**

41. Extended GUI Access / Use May Crash the EdgeRouter

Leaving the EdgeRouter's GUI interface up for extended periods of time (maybe like a day or so) may crash the Edgerouter.

I can't find my original reference, so here is a related one:

One specific example is leaving the GUI open which can cause an unexpected reboot.

We are currently working on a fix for this. It's not convenient,

but saying out of the GUI may prevent these reboots assuming it is the same cause.

<https://community.ubnt.com/t5/EdgeMAX/ER-PRO-8-random-reboots-1-9-7-hotfix-1/td-p/2033684>

42. EdgeRouter Toolbox

In the upper right side of the main page, is a Toolbox button. When you click on it, you will see some nice utilities. See Figure 74 –Toolbox Items.

Figure 74 –Toolbox Items

43. Address Groups

The software in the EdgeRouter allows the user to define Address Groups. These groups are used for convenience. We will define several address groups, including one for each Network. Reference Table 1 - Table of Networks.

Select the “Firewall/NAT” Button from the top of the screen. See Figure 75 – Firewall/NAT Button.

Figure 75 – Firewall/NAT Button

From the tabs that are shown, select “Firewall/NAT Groups”. See Figure 76 – Firewall/NAT Groups Tab.

Figure 76 – Firewall/NAT Groups Tab

Find the “+ Add Group” button and click it. See Figure 77 – Add Group Button.

Figure 77 – Add Group Button

You will see the “Create New Firewall/NAT Group” dialog. Fill in this form as follows:

Name: WIRED_IOT_GROUP

Description: Wired Iot Group

Group Type: Address Group.

See Figure 78 – Example New Address Group Dialog. Press “Save.”

Figure 78 – Example New Address Group Dialog

An empty Address group will have been added. Note that the “Number of group members” is 0. See Figure 79 – Added Address Group.

Name	Description	Type	Number of group members	
WIRED_IOT_GROUP	Wired Iot Group	address-group	0	Actions
Showing 1 to 1 of 1 entries				

Figure 79 – Added Address Group

Press the WIRED_IOT_GROUP's Action button and select Config. See Figure 80 – Address Group Actions

Figure 80 – Address Group Actions

Enter the address specifier of:
192.168.4.0/24

See Figure 81 – Example Edit Address Group. Press “Save.” When it is finished updating, close the dialog.

Figure 81 – Example Edit Address Group

Repeat the above steps for the following address groups. If there is more than one address listed in a group, then you will need to use the "+ Add New" button to add additional address(es) to the group. You have just done the WIRED_IOT_GROUP.

```
group {
  address-group HOME_GROUP {
    address 192.168.3.0/24
    description "Home Group"
  }
  address-group MULTIPLE_GROUP {
    address 192.168.3.0/24
    address 192.168.4.0/24
    address 192.168.6.0/24
    address 192.168.7.0/24
    description "Multiple Groups"
  }
  address-group OPENDNS_SERVERS_GROUP {
    address 208.67.222.222
    address 208.67.220.220
    description "OpenDNS Servers"
  }
  address-group WIFI_GUEST_GROUP {
    address 192.168.6.0/24
    description "Wifi Guest Group"
  }
  address-group WIFI_IOT_GROUP {
    address 192.168.7.0/24
    description "Wifi Iot Group"
  }
  address-group WIRED_IOT_GROUP {
    address 192.168.4.0/24
    description "Wired Iot Group"
  }
  address-group WIRED_SEPARATE_GROUP {
    address 192.168.5.0/24
    description "Wired Separate Group"
  }
}
```

The above text section is from the backup file.

44. EdgeRouter Layman's Firewall Explanation

I initially had trouble understanding the EdgeRouter's firewall rules. The firewall rules that I saw on the internet appeared backwards (in direction) to me. I also didn't understand what "local" rules meant or applied to. Then I found the article "Layman's firewall explanation".

Reference: <https://community.ubnt.com/t5/EdgeMAX/Layman-s-firewall-explanation/td-p/1436103>

I highly recommend that you stop and read that entire posting now.

I have re-produced the main diagram, from that article, as Figure 82 – Layman's Firewall Explanation Diagram. Note that this diagram is for an EdgeRouter Lite, which has its WAN port on eth1. The WAN interface is therefore shown in the middle of this diagram.

Figure 82 – Layman's Firewall Explanation Diagram

A firewall policy (ruleset) is a set of firewall rules along with a default action. The default action can be "accept," "reject," or "drop." A firewall ruleset is applied to a specific interface as well as applied to a specific "direction." For an EdgeRouter, the directions are "In," "Out," and "Local." The "In" direction is input IP packets from the internet, as well as input into the EdgeRouter from devices on a Network (LAN). The "Out" direction consists of IP packets output from the EdgeRouter destined for the internet, as well as output to your Network devices from the EdgeRouter. "Local" refers to IP data coming into the EdgeRouter destined for (services on the) EdgeRouter itself. Reference Figure 82 – Layman's Firewall Explanation Diagram.

Each firewall rule, within a ruleset, also has an action of "accept," "reject," or "drop." Each IP packet attempting to traverse an interface that has firewall rules will be tested by the individual firewall rules, in the ruleset order, until a firewall rule matches the rule's condition criteria. The individual firewall rules contain conditions that need to all be matched for that firewall rule to perform its action. If no firewall rules match an IP packet, then the ruleset's default action is taken for that packet. Once an IP packet matches an individual firewall rule, no other firewall processing is needed for that IP packet.

Firewall rules within the ruleset are applied (tested) in the specific order that they were arranged. Therefore, it is important to order the firewall rules so that the most frequently used rules are arranged at or near the top of the set of rules, allowing for efficiency within the EdgeRouter.

Firewall policies are applied before SNAT (Source Network Address Translation) and after DNAT (Destination Network Address Translation).

The descriptions above are by no means exact regarding what is happening internally. These descriptions are just meant to convey enough information to help understand these firewall rules, their design, and their operation.

Additional References:

<https://help.ubnt.com/hc/en-us/articles/204976664-EdgeMAX-How-are-packets-processed-by-EdgeRouter>

45. Firewall State

There are many conditions available that can constitute a firewall rule. One of the most important conditions is “State.” States are maintained internally by the underlying firewall code that is within the EdgeRouter, and are:

New – a packet starting a new connection

Invalid – packets that have invalid data in them

Established – packets associated with an existing connection (conversation)

Related – packets related to an existing connection (conversation)

46. WAN Firewall Rules

The most important firewall rules in an EdgeRouter, from a security standpoint, are the default WAN_IN and WAN_LOCAL rulesets. These rulesets were generated by the WLAN+2LAN2 Wizard. The firewall rules with these rulesets provide the “firewall” protection associated with (consumer) Network Address Translation (NAT) routers. The WAN_IN and WAN_LOCAL rulesets are identical, except for naming, and for the interface that they are applied to. This is the WAN_IN ruleset, from the backup file:

```
name WAN_IN {
    default-action drop
    description "WAN to internal"
    rule 10 {
        action accept
        description "Allow established/related"
        state {
            established enable
            related enable
        }
    }
    rule 20 {
        action drop
        description "Drop invalid state"
        state {
            invalid enable
        }
    }
}
```

The name of this ruleset is WAN_IN. The rules in this ruleset are applied (not shown here) to the input side of the eth0 interface, i.e., to IP packets that are entering the EdgeRouter from the internet.

This ruleset has a default action of drop. If a packet destined for this interface doesn’t match any firewall rule, then the packet will be dropped.

The first rule (rule 10) in the ruleset has an action of “accept,” and will allow packets that are “established” and “related” (i.e. associated) to an existing IP conversation to enter eth0. The only way to have an existing connection on eth0 is for the connection to have been started from within the EdgeRouter’s system, i.e., from the EdgeRouter itself, or from a device on one of the EdgeRouter Networks. Note that there are no other / additional qualifiers on this rule(s), so it is applied to every IP packet entering from the internet.

The second rule (rule 20) has an action of “drop.” Any packet matching this rule: “invalid state” will be dropped.

QUESTION: I’ve often wondered why the invalid state rule (number 20) has not been placed before the established/related rule (10). For well-behaved web sites this order should not matter. With badly coded web servers, having the invalid rule first might break some web usage. With the advent of malicious advertisements now being served up on legitimate web sites, it seems like it might make sense to place the invalid rule first, and risk some amount of web usage breakage.

47. EdgeRouter Detailed Firewall Setup

I have adapted Figure 82 – Layman’s Firewall Explanation Diagram to my own diagram. See Figure 83 – Detailed Firewall Setup Diagram.

The FireWall Rules (FWR) that are described in this guide are numbered (as FWR*) in Figure 83 – Detailed Firewall Setup Diagram. Each is associated with a named firewall ruleset that will be described in the following sections. FWRs that are colored red means a ruleset terminates with a default of drop, while FWRs colored green mean a default of accept. The firewall rule sets are:

- FWR1 = WAN_LOCAL.
- FWR2 = WAN_IN.
- FWR3 = WIRED_IOT_LOCAL.
- FWR4 = WIRED_SEPARATE_LOCAL.
- FWR5 = WIRED_SEPARATE_IN.
- FWR6 = WIRED_SEPARATE_OUT.
- FWR7 = HOME_OUT (same single set of rules, but shown in two places).
- FWR8 = WIFI_GUEST_LOCAL.
- FWR9 = WIFI_IOT_LOCAL.

The descriptions below are by no means exact regarding what is happening internally. These descriptions are just meant to convey enough information to help understand these firewall rules, their design and their operation.

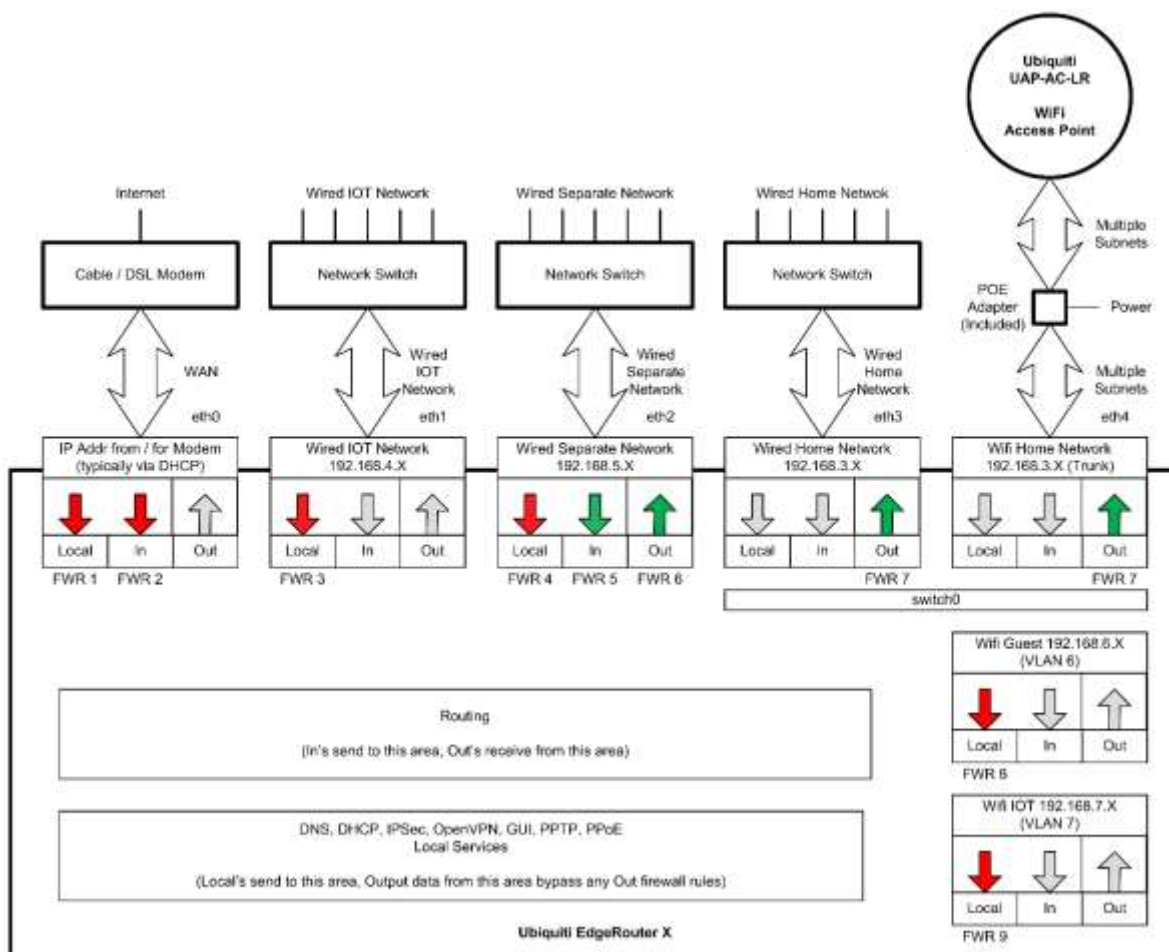

Figure 83 – Detailed Firewall Setup Diagram

48. WAN_LOCAL Firewall Rules

The basic operation of these firewall rules is described above, in the section titled “46 - WAN Firewall Rules”. These rules are FRW1 as shown in Figure 83 – Detailed Firewall Setup Diagram.

Add Optional VPN information, etc...

A VPN link:

<https://help.ubnt.com/hc/en-us/articles/115015971688-EdgeRouter-OpenVPN-Server>

49. WAN_IN Firewall Rules

The basic operation of these firewall rules is described above, in the section titled “46 - WAN Firewall Rules”. These rules are FRW2 as shown in Figure 83 – Detailed Firewall Setup Diagram.

Add forwarded ports, etc...

50. HOME_OUT Firewall Rules

There are six firewall rules in this ruleset. These firewall rules inspect IP packets that are exiting the EdgeRouter towards devices on the Home Network. Reference “FWR7,” shown as two instances, in the upper-right of Figure 83 – Detailed Firewall Setup Diagram.

These six rules are maintained as three sets of two rules per interface, i.e., these two-rule-sets are applied to three interfaces. Each interface is a separate Network. Except for naming and the Network that they are applied to, the sets of two rules are identical. Only one set of two rules are shown here. The three Networks, which these three sets are applied-to, are: Wired Iot Network, Wifi Iot Network, and Wifi Guest Network.

The following section of backup file will be referenced later, so it was given a reference tag of Equation 1 – A Portion of the HOME_OUT Firewall Ruleset.

This is one set of two rules from the backup file:

```
name HOME_OUT {
  default-action accept
  description "Home Out"
  rule 1 {
    action accept
    description "Allow Wired Iot Replies"
    log disable
    protocol all
    source {
      group {
        address-group WIRED_IOT_GROUP
      }
    }
    state {
      established enable
      invalid disable
      new disable
      related enable
    }
  }
  rule 2 {
    action drop
    description "Drop Rest-Of Wired Iot Traffic"
    log disable
    protocol all
    source {
      group {
        address-group WIRED_IOT_GROUP
      }
    }
  }
}
```

...

Equation 1 – A Portion of the HOME_OUT Firewall Ruleset

The name of this ruleset is HOME_OUT. The rules in this ruleset are applied (not shown here) to the output side of both of the eth3 and eth4 interfaces, i.e., switch0. These interfaces are also known as the Home Network. IP packets that are exiting the EdgeRouter (on eth3/eth4) towards equipment on the Home Network are inspected and potentially dropped by these firewall rules. Remember that eth3 and eth4 are still bound together by the switch hardware within the EdgeRouter. In Figure 83 – Detailed Firewall Setup Diagram, this information is shown as duplicated in two blocks (in the upper-right portion of the diagram), each labeled with FWR7.

This ruleset has a default action of “accept.” If a packet destined for this interface doesn’t match any individual firewall rule, then the packet will be accepted, i.e., passed along to devices attached to the Home Network.

The first rule (rule 1) in this ruleset has an action of “accept,” and will allow IP packets that are “established” and “related” (i.e. associated) to an existing IP conversation, to exit the EdgeRouter to devices that are on the Home Network. Note that this rule has an additional qualifier that the source address must be in the address range of the WIRED_IOT_GROUP, i.e., this rule only applies to traffic that originates from the Wired IOT Network. The only way to have an existing connection between Wired IOT Network and the Home Network is for the conversation to have been started from devices within the Home Network. The name associated with this rule is "Allow Wired Iot Replies."

The second rule (rule 2) in this ruleset has an action of “drop,” and will drop all other IP packets that originate from the Wired IOT Network. Note that this rule also has the additional qualifier that the source address must be within the address range of the WIRED_IOT_GROUP. I.e., this rule only applies to traffic that originates from the Wired IOT Network. The name associated with this rule is "Drop Rest-Of Wired Iot Traffic."

These two rules, treated together, describe the IP connections (conversations) that can occur between equipment on the Wired IOT Network and the Home Network.

If the conversation was started by devices in the Home Network and directed to devices residing on the Wired IOT Network, then replies to those conversations will be allowed back into the Home Network by firewall rule number 1. Internally, the firewall code keeps track of IP connections, which are entering the EdgeRouter (the “In” side) and then allows traffic that is related to that data to exit the EdgeRouter towards the Home Network devices.

If a conversation was instead started by devices within the Wired IOT Network and directed towards the Home Network, firewall rule 1 will have no prior knowledge about this conversation (because it is not “established”/“related”). Therefore, firewall rule number 1 will not match, and firewall rule processing will then proceed to rule number 2. Rule number two drops all traffic from the Wired IOT Network.

There are two more sets of two rules (not shown here) within this ruleset, an identical set applied to the Wifi Guest Network (WIFI_GUEST_GROUP), and an identical set applied to the Wifi IOT Network (WIFI_IOT_GROUP).

Remember that the default action for this ruleset is “accept.” You want the Home Network to be able to operate on its own, when it is not conversing with just these three networks.

Note that every IP packet attempting to exit the EdgeRouter towards devices on the Home Network will need to be inspected by these six firewall rules. Most of the traffic destined for the Home Network will not be from one of the IOT or Guest Networks.

QUESTION: Maybe a single firewall rule can be added, at the top of this ruleset, which allows internet traffic to be accepted. This would increase the efficiency of this ruleset, by not depending upon most of the traffic to reach the default “accept” rule before being accepted.

51. Firewall Conditions

The following figures are from the “Add New Rule” firewall dialog. We will explain how to get to these in the next section. There are several Tabs in this dialog for entering firewall conditions. You might want to study the following figures, and familiarize yourself with what firewall conditions are available. See the following figures:

Figure 84 – Firewall Conditions, Basic Tab.

Figure 85 – Firewall Conditions, Advanced Tab.

Figure 86 – Firewall Conditions, Source Tab.

Figure 87 – Firewall Conditions, Destination Tab.

Figure 88 – Firewall Conditions, Time Tab.

The screenshot shows the 'Add New Rule' dialog with the 'Basic' tab selected. The 'Description' field is empty. The 'Enable' checkbox is checked. The 'Action' section has four radio buttons: 'Drop', 'Reject', 'Reject TCP', and 'Accept', with 'Drop' selected. The 'Protocol' section has six radio buttons: 'All protocols', 'TCP', 'UDP', 'Both TCP and UDP', 'Choose a protocol by name', and 'Enter a protocol number', with 'All protocols' selected. The 'Logging' checkbox is unchecked. At the bottom right are 'Save' and 'Cancel' buttons.

Figure 84 – Firewall Conditions, Basic Tab

The screenshot shows the 'Add New Rule' dialog with the 'Advanced' tab selected. The 'State' section has four checkboxes: 'Established', 'Invalid', 'New', and 'Related', all of which are unchecked. The 'Recent Time' and 'Recent Count' fields are empty. The 'IPsec' section has three radio buttons: 'Don't match on IPsec packets', 'Match inbound IPsec packets', and 'Match inbound non-IPsec packets', with 'Don't match on IPsec packets' selected. The 'P2P' section has three radio buttons: 'None', 'All', and 'Choose P2P app(s) by name', with 'None' selected. The 'Application' dropdown menu is set to '-'. At the bottom right are 'Save' and 'Cancel' buttons.

52. Adding Firewall Rules

Hopefully, you now understand the design of the HOME_OUT firewall rules. Now it is time to actually add these rules. This section will use a pair of HOME_OUT rules as an example of how to add firewall rules using the GUI interface.

While you are using the GUI to add these rules, please frequently reference the backup file segment labeled “Equation 1 – A Portion of the HOME_OUT Firewall Rules”, which is in section “50 - HOME_OUT Firewall Rules.” This should help you better relate between the two forms - that of the backup text description versus that of GUI entry.

Select the “Firewall/NAT” button from the top of the screen. Reference Figure 75 – Firewall/NAT Button.

Ensure that the “Firewall Policies” tab is selected. See Figure 89 – Firewall Policies Tab.

Figure 89 – Firewall Policies Tab

The two WAN rulesets, which were added by the Wizard, should be shown. Press the “+ Add Ruleset” button. See Figure 90 – Add Ruleset.

A screenshot showing a "+ Add Ruleset" button at the top left of a table. The table has two columns: "Name" and "Interfaces". It contains two rows: "WAN_IN" with "eth0/in" and "WAN_LOCAL" with "eth0/local". A footer row says "Showing 1 to 2 of 2 entries".

+ Add Ruleset	
Name	Interfaces
WAN_IN	eth0/in
WAN_LOCAL	eth0/local
Showing 1 to 2 of 2 entries	

Figure 90 – Add Ruleset

You will be presented with a “Create New firewall Ruleset.” See Figure 91 – Blank Create New Firewall Ruleset.

A dialog box titled "Create New Firewall Ruleset" with a close button (X) in the top right corner. It contains four fields: "Name" with a blue asterisk and an info icon, "Description", "Default action" with a blue asterisk and three radio buttons (Drop, Reject, Accept), and "Default Log" with a checkbox and an info icon. A "Save" button is at the bottom.

Figure 91 – Blank Create New Firewall Ruleset

Enter the following into the Create New Firewall Ruleset dialog:

Name	HOME_OUT
Description	Home Out
Default action	Accept

See Figure 92 – HOME_OUT Example New Ruleset.

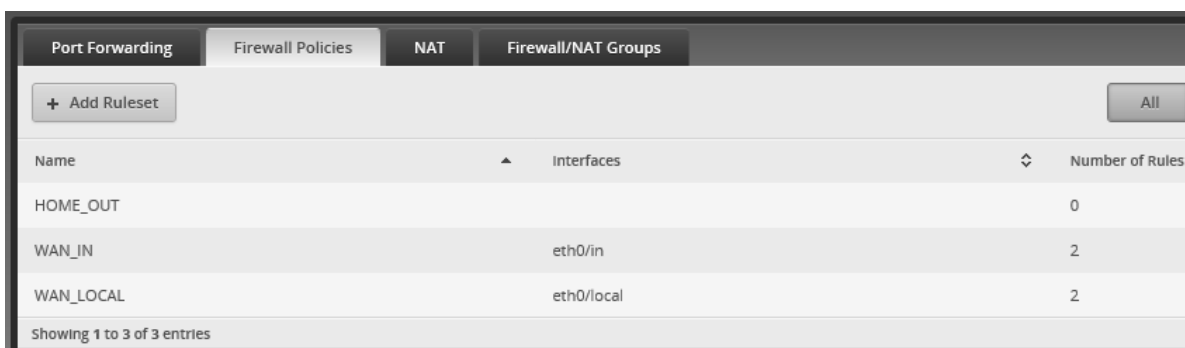

The dialog box titled "Create New Firewall Ruleset" contains the following fields and options:

- Name: HOME_OUT
- Description: Home Out
- Default action: Radio buttons for Drop, Reject, and Accept (Accept is selected).
- Default Log: A checkbox that is currently unchecked.
- A "Save" button at the bottom.

Figure 92 – HOME_OUT Example New Ruleset

Press "Save." A HOME_OUT ruleset will be created. Note that no interfaces have been selected, and the number of rules is 0. See Figure 93 – Empty HOME_OUT Ruleset.

Port Forwarding Firewall Policies NAT Firewall/NAT Groups			
+ Add Ruleset All			
Name	Interfaces		Number of Rules
HOME_OUT			0
WAN_IN	eth0/in		2
WAN_LOCAL	eth0/local		2

Showing 1 to 3 of 3 entries

Figure 93 – Empty HOME_OUT Ruleset.

Find the "Actions" button at the right end of the HOME_OUT line (not shown) and press it. You will be presented with a "Firewall Actions Menu." See Figure 94 – Firewall Actions Menu.

Figure 94 – Firewall Actions Menu

Choose “Edit Ruleset.” A dialog for editing firewall rules appears. The “Rules” Tab should already be selected. See Figure 95 – Edit Ruleset Dialog.

Note that this dialog also contains Tabs of “Configuration,” “Interfaces,” and “Stats.” These match the handy shortcuts that are also in the previously shown Actions menu, reference Figure 94 – Firewall Actions Menu.

Figure 95 – Edit Ruleset Dialog

Choose the “Configuration” Tab. You should see the information that was entered earlier. See Figure 96 – Firewall Rule Configuration Tab.

Figure 96 – Firewall Rule Configuration Tab

Choose the “Interfaces” Tab. Select the following information in the dialog:

Interface switch0
Direction out

Then press the “Save Ruleset” button.

A lot of problems occur because a ruleset is created and the interface / direction is never set and/or saved.

Since the Home Network is governed by switch0 (i.e. switch0 contains interfaces of eth3 and eth4), we need to choose “switch0” for the Interface, not the individual eth3 or eth4. If an interface is not part of switch0 (eth0, eth1, or eth2) then we would just select that individual interface. See Figure 97 – Firewall Rule Interface Tab.

Figure 97 – Firewall Rule Interface Tab

Re-select the “Rules” Tab, and press the “Add New Rule” Button, that is shown in Figure 95 – Edit Ruleset Dialog. An “Add New Rule” dialog will be shown. See Figure 98 – HOME_OUT Firewall, Rule1, Basic. Enter the following into the Basic Tab:

Description	Allow Wired Iot Replies
Enable	CHECKED
Action	Accept
Protocol	All protocols

Figure 98 – HOME_OUT Firewall, Rule1, Basic

Click on the Advanced Tab. See Figure 99 – HOME_OUT Firewall, Rule1, Advanced. Enter the following information into the Advanced Tab:

State, Established	CHECKED
State, Invalid	Un-checked
State, New	Un-checked
State, Related	CHECKED

Figure 99 – HOME_OUT Firewall, Rule1, Advanced

Click on the Source Tab. See Figure 100 – HOME_OUT Firewall, Rule 1, Source. Select the following information for the Source Tab:

Address Group

Wired lot Group.

Figure 100 – HOME_OUT Firewall, Rule 1, Source

Press the “Save” button. You now have a new rule in the HOME_OUT ruleset. See Figure 101 – HOME_OUT Firewall, Rule 1.

Order	Description	Source	Destination	Protocol	Action
1	Allow Wired lot Replies	address group WIRED_lot_GROUP	all	all	accept

Figure 101 – HOME_OUT Firewall, Rule 1

It is time to add the second firewall rule of this ruleset. Press the “Add New Rule” button, as shown in Figure 101 – HOME_OUT Firewall, Rule 1. You will be presented with the Basic dialog for adding firewall rules. See Figure 102 – HOME_OUT Firewall, Rule 2, Basic. Enter the following information into the Basic Tab:

Description Drop Rest-Of Wired lot Traffic
 Enable CHECKED
 Action Drop
 Protocol All protocols

Figure 102 – HOME_OUT Firewall, Rule 2, Basic

Click on the Source Tab. See Figure 103 – HOME_OUT Firewall, Rule 2, Source. Select the following information for the Source Tab:

Address Group Wired Iot Group.

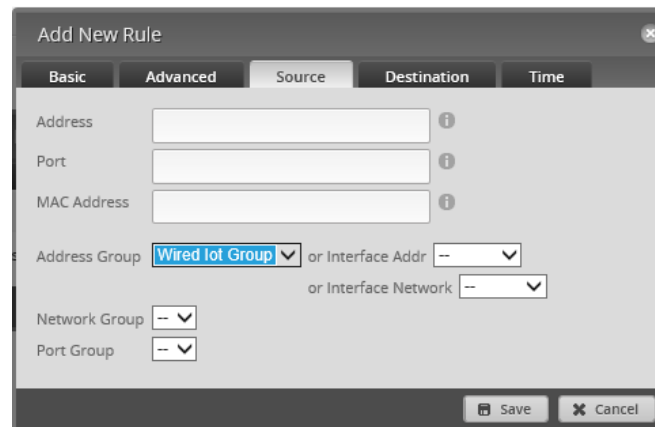

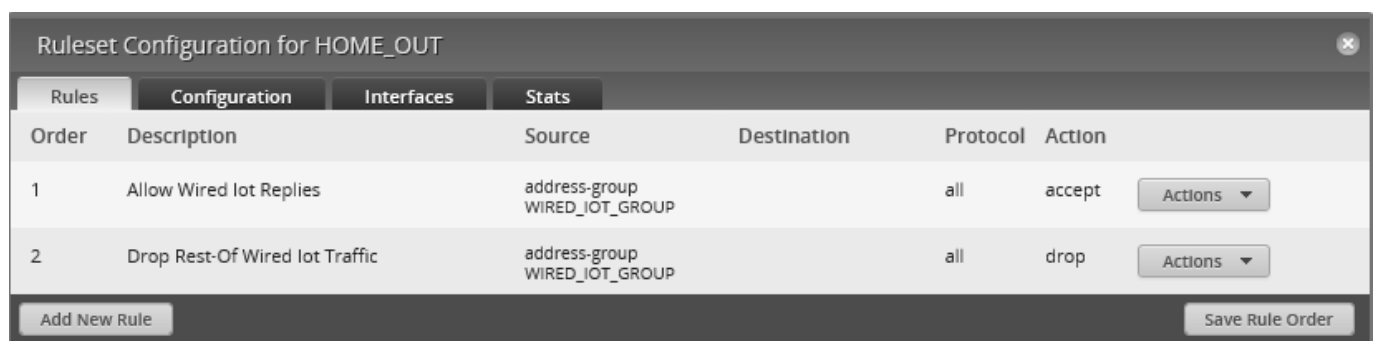

Figure 103 – HOME_OUT Firewall, Rule 2, Source

Press the “Save” button. You now have two rules in the HOME_OUT ruleset, as shown in Figure 104 – HOME_OUT Firewall, Two Rules.

The first rule allow traffic that is “established” and “related” (i.e. associated) to go out FROM the EdgeRouter, towards devices on the Home Network that have a SOURCE address that matches (originated from) the Wired IOT Network. The association would be to traffic that previously went IN (towards the EdgeRouter) destined for the Wired IOT Network. This would typically be a request to a device on the Wired IOT Network from a device on the Home Network.

The second rule drops all traffic from the Wired IOT Network that was not matched by the first rule, i.e., any non-requested traffic that was initiated by the Wired IOT Network.

The default action for the HOME_OUT ruleset is “accept,” allowing traffic that is not SOURCED from the Wired IOT Network to pass OUT to devices on the Home Network. This could be traffic SOURCED from another Network, or traffic coming from the internet, or from the EdgeRouter itself.

Ruleset Configuration for HOME_OUT						
Rules	Configuration	Interfaces	Stats			
Order	Description	Source	Destination	Protocol	Action	
1	Allow Wired Iot Replies	address-group WIRED_IOT_GROUP		all	accept	Actions ▾
2	Drop Rest-Of Wired Iot Traffic	address-group WIRED_IOT_GROUP		all	drop	Actions ▾

Figure 104 – HOME_OUT Firewall, Two Rules

53. Adding More HOME_OUT Firewall Rules

We now need to add four more rules to the HOME_OUT Ruleset. Using the steps that are shown in the above section “52 - Adding Firewall Rules”, add four more rules per the backup data that is shown below:

```
rule 3 {
    action accept
    description "Allow Wifi Guest Replies"
    log disable
    protocol all
    source {
        group {
            address-group WIFI_GUEST_GROUP
        }
    }
    state {
        established enable
        invalid disable
        new disable
        related enable
    }
}
rule 4 {
    action drop
    description "Drop Rest-Of Wifi Guest Traffic"
    log disable
    protocol all
    source {
        group {
            address-group WIFI_GUEST_GROUP
        }
    }
}
rule 5 {
    action accept
    description "Allow Wifi Iot Replies"
    log disable
    protocol all
    source {
        group {
            address-group WIFI_IOT_GROUP
        }
    }
    state {
        established enable
        invalid disable
        new disable
        related enable
    }
}
rule 6 {
    action drop
    description "Drop Rest-Of Wifi Iot Traffic"
    log disable
    protocol all
    source {
        group {
            address-group WIFI_IOT_GROUP
        }
    }
}
```

54. WIRED_IOT_LOCAL, WIFI_IOT_LOCAL Firewall Rules

These rules are FWR3 and FWR9 as shown in Figure 83 – Detailed Firewall Setup Diagram.

The purpose of these rules is to block the use of EdgeRouter local services from these two IOT Networks, except for the use of DNS and the operation of DHCP.

The DHCP protocol uses port 67 and port 68 of UDP.

The DNS protocol uses port 53 of both TCP and UDP.

The DNS firewall rules for the Wired lot and Wifi lot Networks, presented below, contain an additional destination-address restriction. These DNS firewall rules will only accept DNS requests, which are issued to the Open DNS resolver addresses. DNS requests to other providers will be dropped via the ruleset's default drop rule.

Note that the destination addresses specified here (via the OPENDNS_SERVERS_GROUP) must match the Wired lot and Wifi lot Network's DHCP entered DNS1 and DNS2 addresses. Reference section 28 - Add DHCP Servers to the VLANs and section 30 - Modify EdgeRouter's eth1 DHCP Server. It's not good to tell your lot devices to use one set of DNS provider addresses (via DHCP) and then drop those requests when your firewall rules only accept addresses of a different DHCP provider.

We now need to add two more rulesets, with each ruleset containing two firewall rules. Using the steps that are shown in the above section "52 - Adding Firewall Rules", add the following two rulesets, each containing two firewall rules, per the backup data that is shown below:

When adding the following WIRED_IOT_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:      eth1
Direction:     local

name WIRED_IOT_LOCAL {
  default-action drop
  description "Wired IOT Local"
  rule 1 {
    action accept
    description "Allow DHCP"
    destination {
      port 67-68
    }
    log disable
    protocol udp
    source {
    }
  }
  rule 2 {
    action accept
    description "Allow Only OpenDNS"
    destination {
      group {
        address-group OPENDNS_SERVERS_GROUP
      }
      port 53
    }
    log disable
    protocol tcp_udp
  }
}
```

When adding the DNS rule, the above "tcp_ucp" description is shown in the GUI as "Both TCP and UDP."

When adding the following WIFI_IOT_LOCAL ruleset, remember to also set and SAVE the following:

Interface: switch0.7

Direction: local

```
name WIFI_IOT_LOCAL {
  default-action drop
  description "WiFi Iot Local"
  rule 1 {
    action accept
    description "Allow DHCP"
    destination {
      port 67-68
    }
    log disable
    protocol udp
  }
  rule 2 {
    action accept
    description "Allow Only OpenDNS"
    destination {
      group {
        address-group OPENDNS_SERVERS_GROUP
      }
      port 53
    }
    log disable
    protocol tcp_udp
  }
}
```

When adding the DNS rule, the above "tcp_udp" description is shown in the GUI as "Both TCP and UDP."

55. WIFI_GUEST_LOCAL Firewall Rules

The purpose of these rules is to block the use of EdgeRouter local services from the Wi-Fi Guest Network, except for the use of DNS and the operation of DHCP.

To add the following ruleset and rules, follow what was done in the above section 54 - WIRED_IOT_LOCAL, WIFI_IOT_LOCAL Firewall Rules.

Note that we are not dropping DNS requests based upon which DNS provider address(es) your guests may be using in their devices. Most people's devices are probably configured just to use the providers' (provided via DHCP) DNS resolvers addresses. If a guest hardcoded the DNS resolver addresses within their device AND we only accepted DNS requests going to specific DNS resolvers, then we could have just denied our guests service on our network.

When adding the following WIFI_GUEST_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:    switch0.6
Direction:    local

name WIFI_GUEST_LOCAL {
  default-action drop
  description "Wifi Guest Local"
  rule 1 {
    action accept
    description "Allow DHCP"
    destination {
      port 67-68
    }
    log disable
    protocol udp
  }
  rule 2 {
    action accept
    description "Allow DNS"
    destination {
      port 53
    }
    log disable
    protocol tcp_udp
  }
}
```

56. Optional DNS Forcing of the WIFI_GUEST_LOCAL Network

Performing the steps within this section is optional.

The destination Network Address Translation (NAT) rules, presented here, will force any devices on the guest Network to only be able to use Open DNS resolvers. This is regardless of if the devices specify their own DNS resolver addresses and ignore the DNS resolver addresses suggested by the EdgeRouter's guest DHCP server.

The two rules presented here work with each other. Rule #1 will exclude NAT from being performed on either of the OpenDNS resolver addresses. These two addresses are in an address group. This allows both the primary and secondary resolver addresses to pass-through the EdgeRouter from the Guest Network. Rule #2 will act upon any port 53 (DNS) request from the Guest network, and translate the associated IP address into the address of the primary OpenDNS resolver.

Press the Firewall/NAT button near the top of the screen. Reference Figure 75 – Firewall/NAT Button.

Ensure that the NAT tab is selected and then press the “+ Add Destination NAT Rule” button. See Figure 105 – NAT Tab.

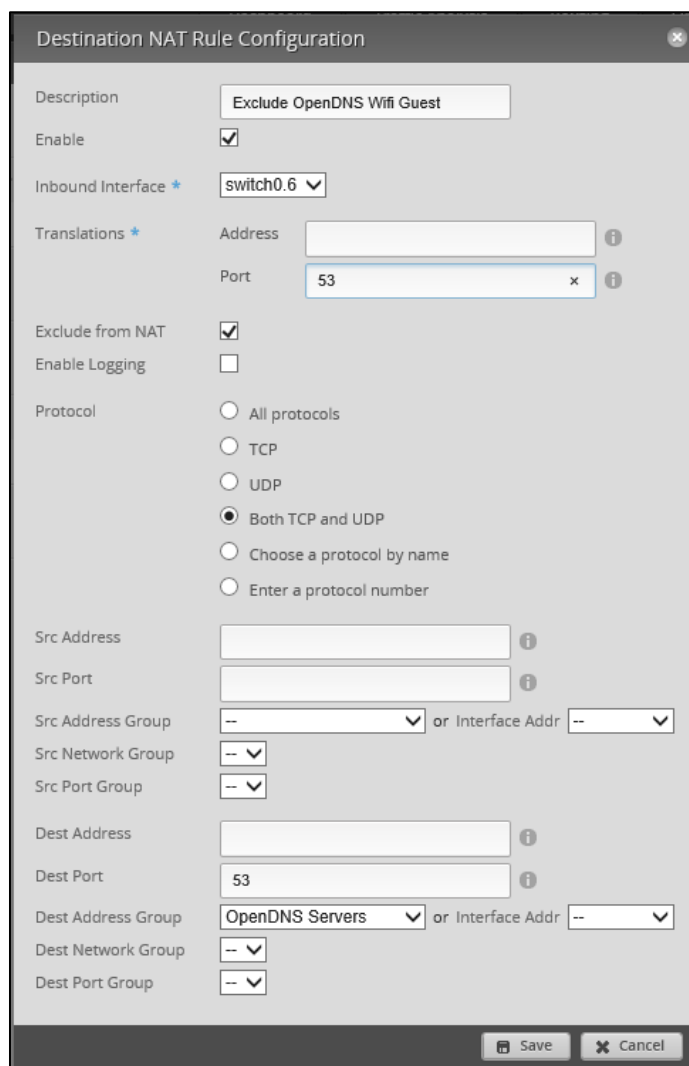

Figure 105 – NAT Tab

You will be presented with a “Destination NAT Rule Configuration” dialog.

Enter the data for NAT rule #1, as follows:

Description	Exclude OpenDNS Wifi Guest
Enable	CHECKED
Inbound Interface	switch0.6
Translations, Port	53
Exclude From NAT	CHECKED
Protocol	Both TCP and UDP
Dest Port	53
Dest Address Group	OpenDNS Servers

and save it. See Figure 106 – NAT Rule Number 1.

The image shows a "Destination NAT Rule Configuration" dialog box. The fields are as follows:

- Description: Exclude OpenDNS Wifi Guest
- Enable: ☒
- Inbound Interface: switch0.6
- Translations: Address (empty), Port: 53
- Exclude from NAT: ☒
- Enable Logging: ☐
- Protocol: ☒ Both TCP and UDP
- Src Address: (empty)
- Src Port: (empty)
- Src Address Group: -- or Interface Addr: --
- Src Network Group: --
- Src Port Group: --
- Dest Address: (empty)
- Dest Port: 53
- Dest Address Group: OpenDNS Servers or Interface Addr: --
- Dest Network Group: --
- Dest Port Group: --

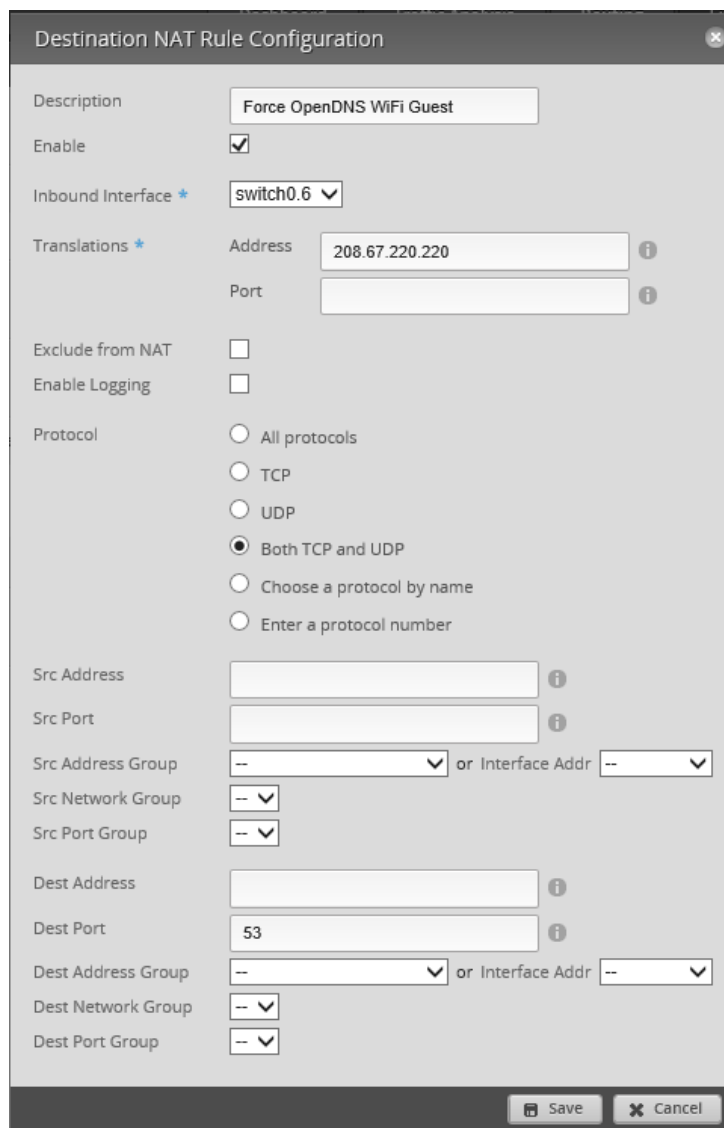

Buttons at the bottom: Save, Cancel

Figure 106 – NAT Rule Number 1

Press the “+ Add Destination NAT Rule” button and enter the data for NAT rule #2, as follows:

Description	Force OpenDNS Wifi Guest
Enable	CHECKED
Inbound Interface	switch0.6
Translations, Address	208.67.220.220
Exclude From NAT	Un-Checked
Protocol	Both TCP and UDP
Dest Port	53

and save it. See Figure 107 – NAT Rule Number 2.

The image shows a 'Destination NAT Rule Configuration' dialog box with the following fields and values:

- Description: Force OpenDNS WIFI Guest
- Enable: ☒
- Inbound Interface *: switch0.6
- Translations *: Address: 208.67.220.220, Port: (empty)
- Exclude from NAT: ☐
- Enable Logging: ☐
- Protocol: ☒ Both TCP and UDP
- Src Address: (empty)
- Src Port: (empty)
- Src Address Group: -- or Interface Addr: --
- Src Network Group: --
- Src Port Group: --
- Dest Address: (empty)
- Dest Port: 53
- Dest Address Group: -- or Interface Addr: --
- Dest Network Group: --
- Dest Port Group: --

Buttons at the bottom: Save, Cancel

Figure 107 – NAT Rule Number 2

This is the relevant portion from the backup file. Rule 5010 is an existing Source NAT rule for handling the WAN port (eth0).

```
nat {
  rule 1 {
    description "Exclude OpenDNS Wifi Guest"
    destination {
      group {
        address-group OPENDNS_SERVERS_GROUP
      }
      port 53
    }
    exclude
    inbound-interface switch0.6
    inside-address {
      port 53
    }
    log disable
    protocol tcp_udp
    type destination
  }
  rule 2 {
    description "Force OpenDNS WiFi Guest"
    destination {
      port 53
    }
    inbound-interface switch0.6
    inside-address {
      address 208.67.220.220
    }
    log disable
    protocol tcp_udp
    type destination
  }
  rule 5010 {
    description "masquerade for WAN"
    outbound-interface eth0
    type masquerade
  }
}
```

These rules can be tested, if you are implementing this DNS forcing using actual OpenDNS resolvers. This is because OpenDNS has a test page:

<http://welcome.opendns.com>

that can show if you are using OpenDNS as a resolver.

To perform this test, first temporarily change the DNS resolvers associated with the Guest Network's DHCP server (switch0.6) to something else. I used addresses of 8.8.8.8 and 8.8.4.4 from Google. Reference section 28 - Add DHCP Servers to the VLANs. Then, using a device attached to the Guest Network, visit the OpenDNS test page. If you get their success page, then these two rules translated the Google DNS addresses into OpenDNS addresses. You may have to reboot the EdgeRouter and/or the Guest device to ensure that the changed DNS resolver addresses propagated to the Guest device. Remember to return the Guest Network's DNS resolver addresses (in the DHCP area) back to the OpenDNS addresses.

Reference this OpenDNS page about testing:

<https://support.opendns.com/hc/en-us/articles/227986567-How-to-Test-for-Successful-OpenDNS-Configuration->

57. WIRED_SEPARATE Firewall Rules

The Wired Separate Network is meant to be kept separate from the other Networks, i.e., not allow communications with anyone except with the Internet.

There are two usage scenarios, which I can think of, for the Separate Network.

1. You might want to put your banking computer on this Separate Network.
In this instance, people and devices on the Home Network cannot get to your banking computer.
2. You might want to provide internet access to the friend's kid who lives in your basement.
In this instance, you don't want any people or devices on the Separate Network to be able to access any of your Networks, or be able to access internals of the EdgeRouter.

Reference Figure 83 – Detailed Firewall Setup Diagram, for FWR numbers and Network routing / interactions

Reference Table 1 - Table of Networks, for Network subnet addresses

To block instance number 1, we need to block traffic from exiting OUT of the EdgeRouter and going to devices that are on the Separate Network. This ruleset will be labeled WIRED_SEPARATE_OUT and is denoted as FWR6. This ruleset will need to block addresses from the WIRED_IOT_GROUP and the HOME_GROUP.

Note that two of the Networks: "Wifi IOT Network" and "Wifi Guest Network" are using VLANs and originate from the Access Point. Within the Access Point, these Networks will be configured as Guest Networks, and will therefore be denied access to all of the EdgeRouter's addresses except for the Home Network, which is at 192.168.3.X. So no firewall rules are needed to block these two Networks from accessing the Wired Separate Network, unless you have disabled configuring these as Guest Networks.

To add the following ruleset and rules, follow what was done in the above section 54 - WIRED_IOT_LOCAL, WIFI_IOT_LOCAL Firewall Rules.

When adding the following WIRED_SEPARATE_OUT ruleset, remember to also set and SAVE the following:

```
Interface:      eth2
Direction:      out

name WIRED_SEPARATE_OUT {
  default-action accept
  description "Wired Separate Out"
  rule 1 {
    action drop
    description "Drop Home Network"
    log disable
    protocol all
    source {
      group {
        address-group HOME_GROUP
      }
    }
  }
  rule 2 {
    action drop
    description "Drop Wired Iot Network"
    log disable
    protocol all
    source {
      group {
        address-group WIRED_IOT_GROUP
      }
    }
  }
}
```

To block instance number 2, we need to block traffic from entering IN the EdgeRouter and going to devices that are on the other networks. This ruleset will be labeled WIRED_SEPARATE_IN and is denoted as FWR5. Additionally, we need to block traffic from entering the EdgeRouter itself (LOCAL) except for DNS and DHCP requests. This ruleset will be labeled WIRED_SEPARATE_LOCAL and is denoted as FWR4.

When adding the following WIRED_SEPARATE_IN ruleset, remember to also set and SAVE the following:

```
Interface:    eth2
Direction:    in

name WIRED_SEPARATE_IN {
    default-action accept
    description "Wired Separate In"
    rule 1 {
        action drop
        description "Block Multiple Networks"
        destination {
            group {
                address-group MULTIPLE_GROUP
            }
        }
        log disable
        protocol all
    }
}
```

When adding the following WIRED_SEPARATE_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:    eth2
Direction:    local

name WIRED_SEPARATE_LOCAL {
    default-action drop
    description "Wired Separate Local"
    rule 1 {
        action accept
        description "Allow DHCP"
        destination {
            port 67-68
        }
        log disable
        protocol udp
    }
    rule 2 {
        action accept
        description "Allow DNS"
        destination {
            port 53
        }
        log disable
        protocol tcp_udp
    }
}
```

58. EdgeMax Change Interface Names

Press the Dashboard Button. Reference Figure 34 – Dashboard Button.

Find the line with an Interface of “switch0”. Click on the Action button to the right of this line. Select “Config” from the Actions Menu. You will see a dialog similar to Figure 37 – switch0 Configuration. Change the Description field to “Home Net.”

Repeat these steps for the following Interfaces as shown in Table 4 - Table of Interface Names:
(You have just done the last one)

Interface	Description
eth1	Wired lot Net
eth2	Wired Separate Net
eth3	Home Net
eth4	Home Net
switch0	Home Net

Table 4 - Table of Interface Names

59. SmartQueue Setup

This section is optional. Turning on SmartQueue (on your WAN port) can help solve the issue of “bufferbloat”. Reference the internet for “bufferbloat” if you are unfamiliar with it. Smart Queue is a variety of Quality of Service (QoS.) Enabling QoS may disable the hardware acceleration that was enabled in section 32 - EdgeRouter Enable HW NAT Assist. I think that if you only enable this on the WAN port, that HW acceleration will stay enabled.

To enable SmartQueue, press the QoS button, located near the top of the page. See Figure 108 – QoS button.

Figure 108 – QoS button

Ensure that the Smart Queue tab is selected, then press the “+ Add Smart Queue” button.

From what I understand, you should enter about 95% of you connection speeds into the form. My connection speeds are 26 down and about 5 up. Adjust the values for your own connection speed(s). There are also posting / indications that you should only implement SmartQueue in the Upload direction.

One place to test connection speeds (and bufferbloat) is:

<http://www.dslreports.com/speedtest>

See Figure 109 – Example SmartQueue Settings

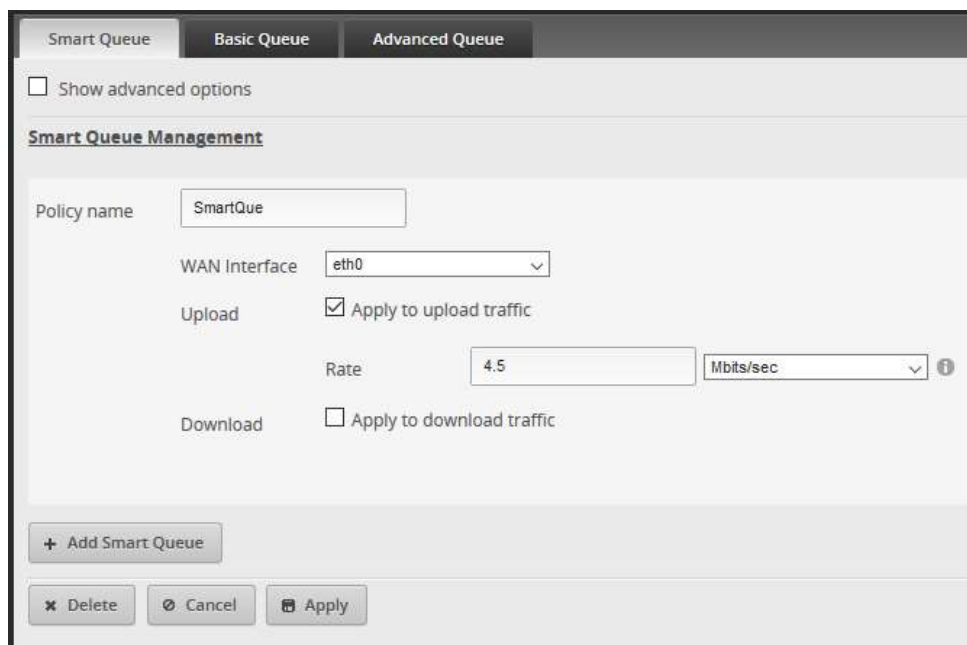

Figure 109 – Example SmartQueue Settings

References:

<https://www.youtube.com/watch?v=3hvmzEv8iNQ>

<http://kazoo.ga/edgerouter-x-smart-queue/>

https://www.reddit.com/r/Ubiquiti/comments/5otj22/edgerouter_x_qos_question/

This is the end of the ER-X BASIC setup.

60. Ubiquiti AP-AC-LR Access Point Setup

This guide will utilize Access Point software installed on a Windows PC. This software ONLY needs to be running WHEN you are adopting or making configuration changes to your Access Point(s). The software does NOT need to be running all the time.

Other Ubiquiti Access points should work; the Ubiquiti AP-AC-LR model is just the one that I purchased.

There are also clients available for Linux, Macs, Android phones and Apple phones.

There are optional guest portal / data-collection features that require this software to be running all the time. These features might be found in a Motel/Hotel WiFi system. Some people choose to therefore install and then continuously run this software on a Raspberry Pi. Ubiquiti has a Cloud Key device that is recommended, if you are going to be running this software all the time.

I have now purchased a Cloud-Key and played with it. Having this device saves the hassle of installing the UniFi (and Java) software on a PC. The configuration steps look the same / similar. Pricing seems about \$80.

Reference: <https://www.ubnt.com/unifi/unifi-cloud-key/>

If you are going to re-purpose a consumer router as an access point, instead of using an Ubiquiti Access Point, remember that some of the Network security is achieved via VLANs and Guest options within the Access Point. Firewall rules within the EdgeRouter may need to be adjusted, probably additional Guest Control Post-Authorization Restrictions. See near Figure 143 –UniFi Guest Control.

61. Hookup the Ubiquiti AP-AC-LR Access Point

Using two standard Ethernet cables:

Wire the EdgeRouter's eth4 port to the LAN port of the included Power Over Ethernet (POE) Adapter.

Wire the POE port of the POE adapter to the Ethernet port on the Ubiquiti AP-AC-LR Access Point.

See Figure 110 – Access Point Wiring.

Plug the POE adapter into your main electrical power.

Note: Connecting the POE port of the POE adapter to any other device will probably burn-up that other device.

There are also internet posts that have the POE adapter powering both the ER-X and the AP-AC-LR Access point. I am not powering my devices that way. Ubiquiti seems to be changing its Access Point voltages / powering options.

Figure 110 – Access Point Wiring

62. Download and Install the Access Point Software

For Windows users, you will need to be an Administrator, or the installation will install (somewhere else) in the area belonging to the admin's account that was used.

Browse to:

<https://www.ubnt.com/download/unifi/>

Under the SOFTWARE section, download the NEWEST “UniFi Controller for Windows” software (Unifi-installer.exe). When this guide was written, it was version 5.4.11.

Under the DOCUMENTATION section, you might also want to download:

UniFi Controller v5 Users Guide (or later version)

UniFi AC-LR-AP Quick Start Guide.

The following install items may be slightly out of order between your installation and that of this guide. I had to re-start my UniFi Setup. You might also reference <https://github.com/mjp66/Ubiquiti/issues/7>

Run the Unifi-installer.exe. Acknowledge any Windows admin prompts. See Figure 111 – UniFi Setup Welcome Screen.

Figure 111 – UniFi Setup Welcome Screen

If Java is not installed on your PC, you will be prompted to install Java. See Figure 112 – UniFi Java Required. Click “OK”.

Figure 112 – UniFi Java Required

You will be taken to an Oracle site to download Java. Click on the “Free Java Download” button. See Figure 113 – Unifi Download Oracle Java. Note that Oracle asks “Why download Java?” My only answer is “Because I have to”.

Figure 113 – Unifi Download Oracle Java

While downloading, Oracle will inform you that their security holes are found everywhere, and that you can experience that also. See Figure 114 – Unifi Downloading Oracle Java.

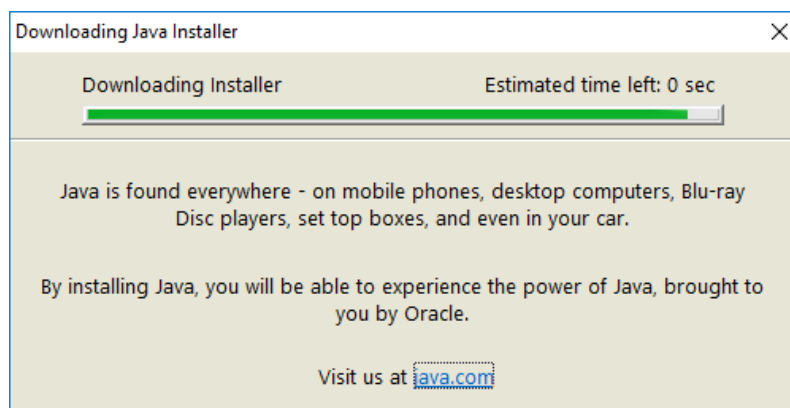

Figure 114 – Unifi Downloading Oracle Java

When done downloading, they will try and monetize you by setting up crapware. Select “Do not update browser settings”, unless you like this type of stuff. See Figure 115 – UniFi Oracle Crapware.

Figure 115 – UniFi Oracle Crapware

Run the downloaded JavaSetup*.exe executable. Java will install. Oracle will again inform you that they are probably responsible for hundreds of billions of accumulated security holes, with billions of them in internet connected devices that will never be patched. See Figure 116 –UniFi Java Installing.

When Java is done installing you will see the dialog of See Figure 117 – UniFi Java Done. Press “Close”. When the next browser window opened (to verify Java is working), I closed that browser verify page.

Figure 116 –UniFi Java Installing

Figure 117 – UniFi Java Done

Press the Windows Start button; Go to the list of programs, select Java, then select “Configure Java”. Press the “Security” tab, and UNCHECK the “Enable Java content in the browser” checkbox. See Figure 118 – UniFi Java Control Panel. Without this you will be live-bait for any drive-by browsing malware.

Figure 118 – UniFi Java Control Panel

I had to restart the UniFi installer. See Figure 119 – UniFi Installing.

Figure 119 – UniFi Installing

The UniFi software will finish installing. See Figure 120 – UniFi Done Installing

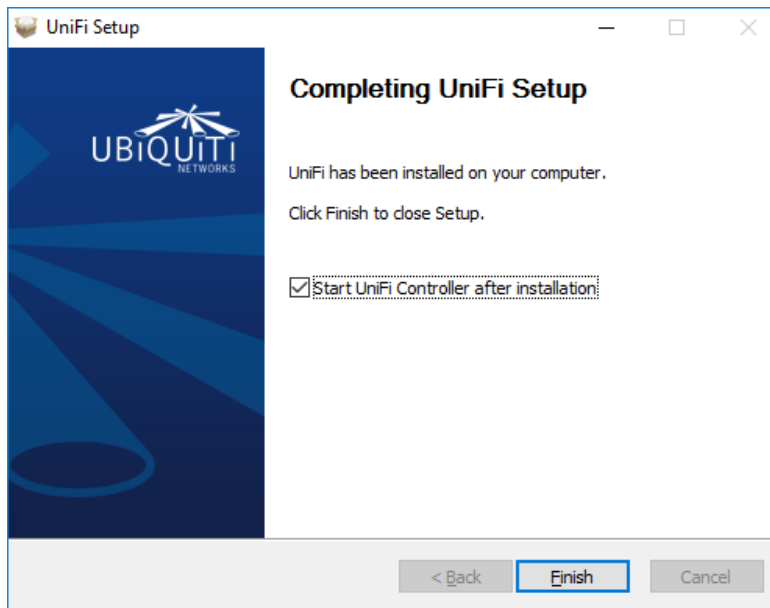

Figure 120 – UniFi Done Installing

63. Running the UniFi Software

Double click the UniFi icon on your desktop. See Figure 121 – UniFi Icon

Figure 121 – UniFi Icon

The UniFi controlling software will start to initialize. See Figure 122 – UniFi Controller Software Initializing.

Figure 122 – UniFi Controller Software Initializing

When it has fully started, it will look like Figure 123 – UniFi Controller Software Running.

Figure 123 – UniFi Controller Software Running

When the UniFi Software started for the first time, a Windows Firewall dialog popped up. See Figure 124 – Windows Initial Firewall - UniFi.

Figure 124 – Windows Initial Firewall - UniFi

The wording and default selections seem backwards to me. I reversed the selections and pressed “Allow access”. See Figure 125 – Windows My Firewall Settings - UniFi.

Figure 125 – Windows My Firewall Settings - UniFi

QUESTION: Which settings are correct for keeping Java to only my local / private network?

64. Initial Setup of the UniFi Software

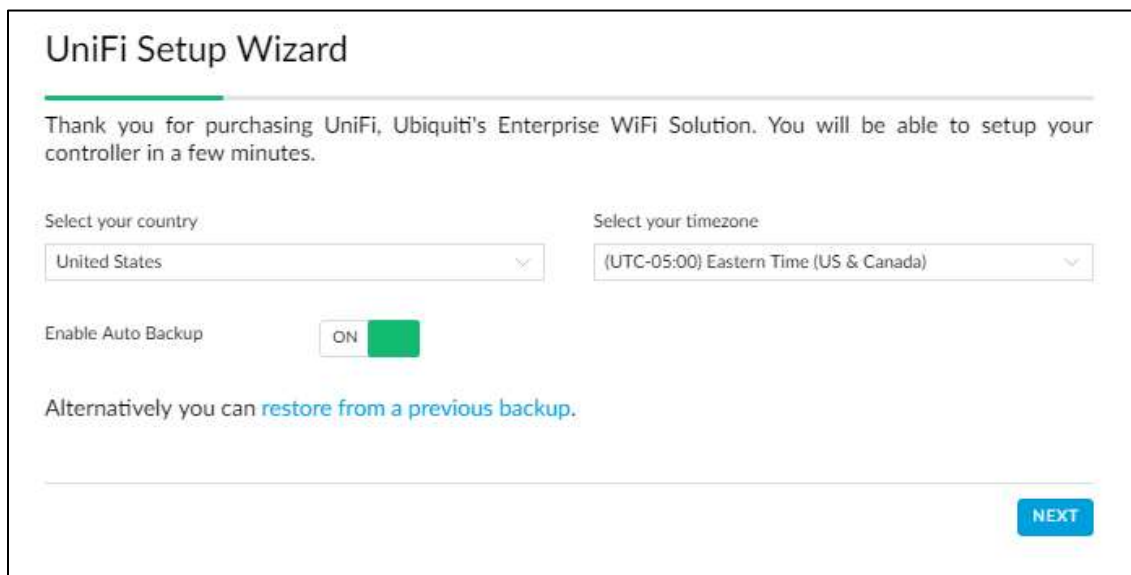

Either press the “Launch a Browser to Manage the Network” button or enter:

<https://localhost:8443/manage>

into your browser.

Most of the following screenshots are portions of the full browser screen.

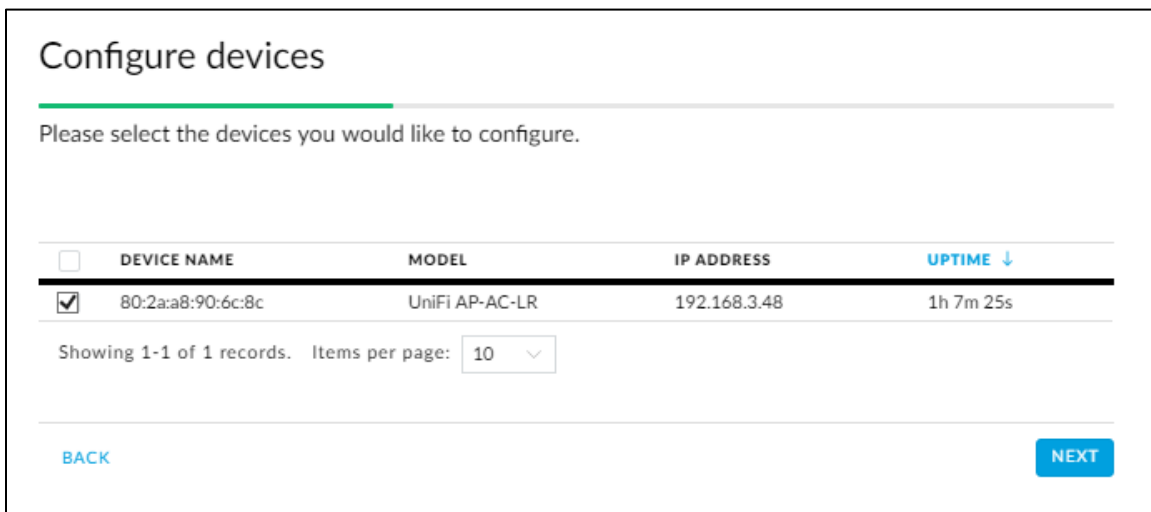

Select your country, time zone, and enable Auto Backup”, then press Next. See Figure 126 – UniFi Setup Wizard.

The screenshot shows the 'UniFi Setup Wizard' interface. It has a title bar with a green progress indicator. Below the title, a message says: 'Thank you for purchasing UniFi, Ubiquiti's Enterprise WiFi Solution. You will be able to setup your controller in a few minutes.' There are two dropdown menus: 'Select your country' with 'United States' selected, and 'Select your timezone' with '(UTC-05:00) Eastern Time (US & Canada)' selected. Below these is a toggle for 'Enable Auto Backup' which is currently 'ON' with a green indicator. A link says 'Alternatively you can restore from a previous backup.' At the bottom right is a blue 'NEXT' button.

Figure 126 – UniFi Setup Wizard

Your Ubiquiti Access Point should show up in the list. Check it and then press Next. See Figure 127 – UniFi Configure Devices.

The screenshot shows the 'Configure devices' screen. It has a title bar with a green progress indicator. Below the title, it says 'Please select the devices you would like to configure.' There is a table with the following columns: 'DEVICE NAME', 'MODEL', 'IP ADDRESS', and 'UPTIME ↓'. The first row is checked and shows '80:2a:a8:90:6c:8c', 'UniFi AP-AC-LR', '192.168.3.48', and '1h 7m 25s'. Below the table, it says 'Showing 1-1 of 1 records. Items per page: 10'. At the bottom left is a blue 'BACK' button and at the bottom right is a blue 'NEXT' button.

<input type="checkbox"/>	DEVICE NAME	MODEL	IP ADDRESS	UPTIME ↓
<input checked="" type="checkbox"/>	80:2a:a8:90:6c:8c	UniFi AP-AC-LR	192.168.3.48	1h 7m 25s

Figure 127 – UniFi Configure Devices

You will see the initial configure WiFi screen. See Figure 128 – UniFi Initial Configure WiFi.

Configure WiFi

You may skip this step if you are not setting up any UniFi access points.

Secure SSID Security Key

Optionally, you may create an open wireless network for your guests:

☐ Enable Guest Access

BACK SKIP NEXT

Figure 128 – UniFi Initial Configure WiFi

Fill in your main network's SSID and your WiFi password. I used the name "HomeNet" for this guide. This is the WiFi network that most of your computers, tablets, and cell phones will connect to. Leave the Enable Guest Network as UNCHECKED, and then press Next. See Figure 129 – UniFi Configure Wifi SSID.

Configure WiFi

You may skip this step if you are not setting up any UniFi access points.

HomeNet

Optionally, you may create an open wireless network for your guests:

☐ Enable Guest Access

BACK SKIP NEXT

Figure 129 – UniFi Configure Wifi SSID

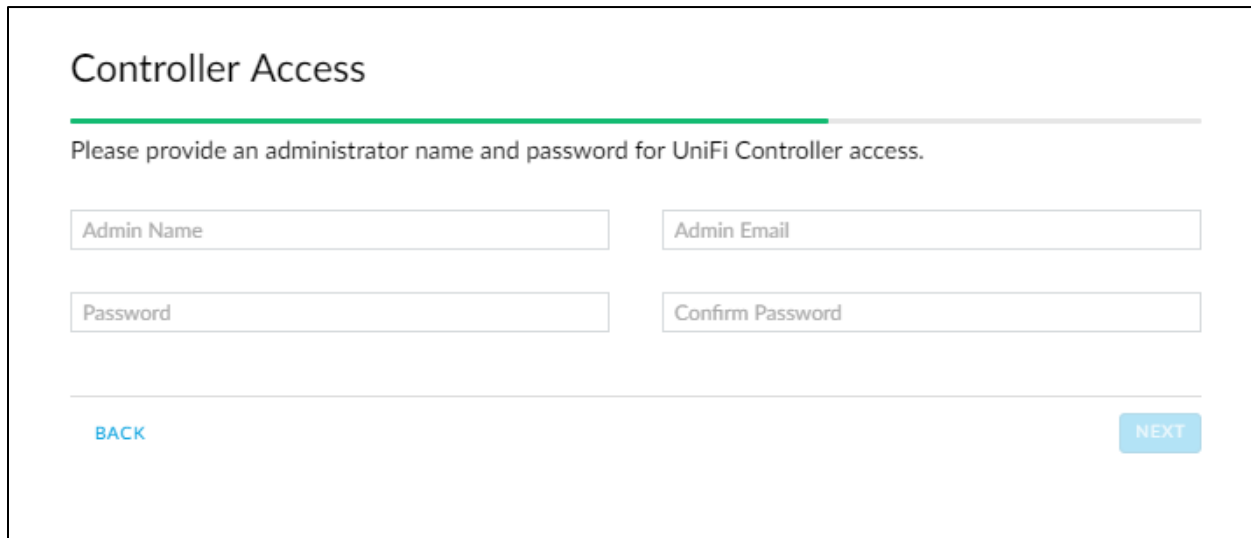

To access this UniFi software later on, fill in the following information:

Admin Name

Admin Email

Password

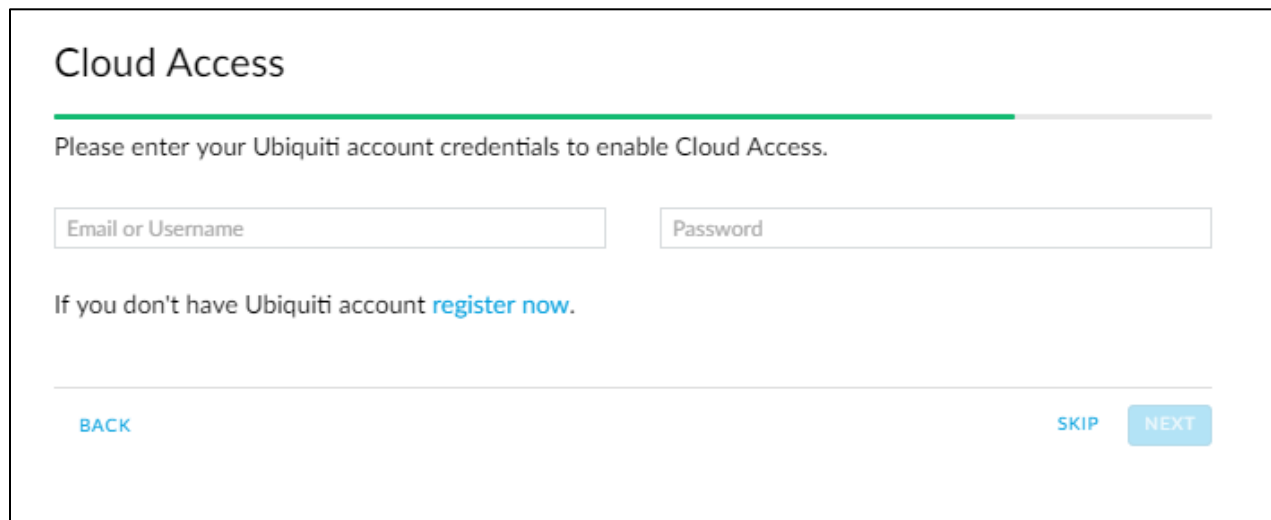

You will want to write these down and/or put them in your password safe. The email address is used for password recovery. When finished, press Next. See Figure 130 – UniFi Controller Access.

The screenshot shows the 'Controller Access' setup screen. At the top, there is a title 'Controller Access' followed by a progress bar that is approximately 60% complete. Below the title, a message reads: 'Please provide an administrator name and password for UniFi Controller access.' There are four input fields arranged in two rows: 'Admin Name' and 'Admin Email' in the first row, and 'Password' and 'Confirm Password' in the second row. At the bottom of the form, there are two buttons: 'BACK' on the left and 'NEXT' on the right.

Figure 130 – UniFi Controller Access

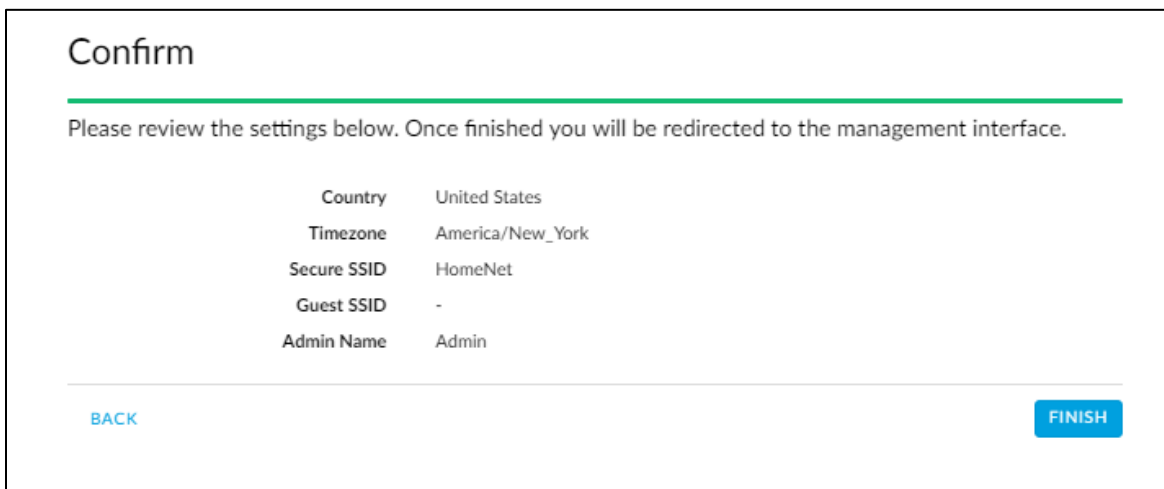

Since I am not using Cloud Access, I pressed Skip. See Figure 131 – UniFi Cloud Access.

The screenshot shows the 'Cloud Access' setup screen. At the top, there is a title 'Cloud Access' followed by a progress bar that is approximately 70% complete. Below the title, a message reads: 'Please enter your Ubiquiti account credentials to enable Cloud Access.' There are two input fields: 'Email or Username' and 'Password'. Below the input fields, there is a line of text: 'If you don't have Ubiquiti account [register now](#).' At the bottom of the form, there are three buttons: 'BACK' on the left, 'SKIP' in the middle, and 'NEXT' on the right.

Figure 131 – UniFi Cloud Access

You are then asked to confirm the above information. If it is correct, press Finish. See Figure 132 – UniFi Confirm Setup.

The image shows a 'Confirm' setup screen for UniFi. At the top, the word 'Confirm' is displayed in a large, dark font. Below it, a horizontal line separates the title from the instructions: 'Please review the settings below. Once finished you will be redirected to the management interface.' A table of settings is centered on the screen, listing 'Country' (United States), 'Timezone' (America/New_York), 'Secure SSID' (HomeNet), 'Guest SSID' (-), and 'Admin Name' (Admin). At the bottom of the screen, there are two buttons: a blue 'BACK' button on the left and a blue 'FINISH' button on the right.

Country	United States
Timezone	America/New_York
Secure SSID	HomeNet
Guest SSID	-
Admin Name	Admin

Figure 132 – UniFi Confirm Setup

65. Login to the UniFi Software

You will be asked to login to the UniFi Software. See Figure 133 – UniFi Login. Use your newly created credentials that were entered at Figure 130 – UniFi Controller Access.

The image shows the UniFi login screen. At the top, the UniFi logo is displayed with the version number '5.4.11' below it. Below the logo, there are two input fields: 'Username' with the text 'Admin' entered, and 'Password' with a masked password represented by dots. Below the password field, there is a 'Remember me' checkbox which is checked, and a small circular icon to its right. A large blue 'SIGN IN' button is positioned below the login fields. At the bottom of the screen, there is a link that says 'FORGOT PASSWORD?'.

Username: Admin

Password: [masked]

☒ Remember me

SIGN IN

[FORGOT PASSWORD?](#)

Figure 133 – UniFi Login

You will land on the Dashboard page. See Figure 134 – Initial UniFi Dashboard Page

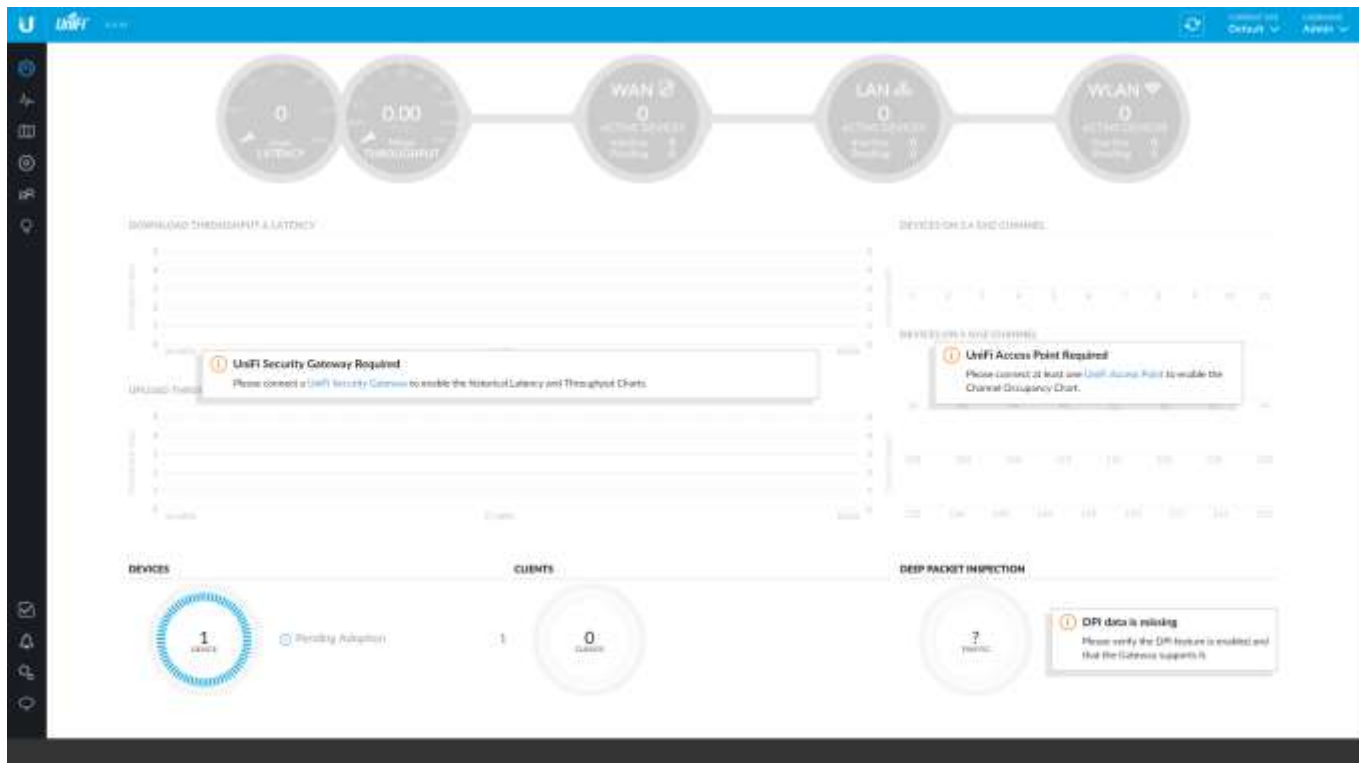

Figure 134 – Initial UniFi Dashboard Page

From the upper left hand side choose Devices. See Figure 135 – UniFi Devices Button.

Figure 135 – UniFi Devices Button

66. UniFi Devices

You will see the devices page, and the Access Point should be Pending Adoption. See Figure 136 – Initial UniFi Device Screen. Note that this screenshot / figure was cut into two pieces and folded into one image.

Figure 136 – Initial UniFi Device Screen

Press the Upgrade button on the right side of the device line. Reference Figure 136 – Initial UniFi Device Screen. You will be presented with an upgrade confirmation dialog. Press Confirm. See Figure 137 – UniFi - Upgrade Access Point

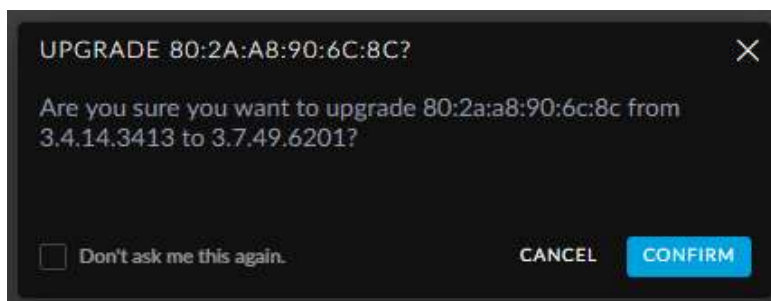

Figure 137 – UniFi - Upgrade Access Point

You should see acknowledgement of the upgrade. See Figure 138 – UniFi – Upgrading.

Figure 138 – UniFi – Upgrading Access Point

When the upgrade is finished, press the Adopt button on the right side of the device line. Reference Figure 136 – Initial UniFi Device Screen. You should see acknowledgement of the Adoption. See Figure 139 – UniFi – Adopting.

Figure 139 – UniFi – Adopting Access Point

Your device should now say Connected. The buttons on the right now allow you to locate, restart, and upgrade the Access Point. See Figure 140 – UniFi Access Point Connected. Note that this screenshot / figure was cut into two pieces and folded into one image.

Find the Settings button, near the lower left side of the screen, and press it. See Figure 141 – Settings Button

Figure 141 – Settings Button

67. UniFi Settings

You should see the Site Tab of the Settings page. Check Automatically Upgrade firmware, and then press Apply Changes. See Figure 142 – UniFi Site Configuration.

The screenshot shows the UniFi Settings page with the 'Site' tab selected. The left sidebar contains a menu with options: Site, Wireless Networks, Hotspot 2.0 (marked BETA), Networks, Routing & Firewall (marked BETA), Guest Control, Profiles, Admins, User Groups, DPI, Controller, Cloud Access, Maintenance, and Auto Backup. The main content area is titled 'SITE CONFIGURATION' and is divided into two sections: 'SITE CONFIGURATION' and 'SERVICES'. Under 'SITE CONFIGURATION', there are fields for Site Name (Default), Country (United States), and Timezone (UTC-05:03 Eastern Time (US & Canada)). Under 'SERVICES', there are several checkboxes: 'Enable advanced features' (unchecked), 'Automatically upgrade firmware' (checked), 'Enable status LED' (checked), 'Enable alert emails' (checked), 'Enable periodic speed test every 20 minutes' (unchecked), 'Configure VoIP port as WAN2 on UniFi Security Gateway 3P' (unchecked), 'Enable connectivity monitor and wireless uplink' (checked), 'Enable automatic uplink fallback' (unchecked), 'Default gateway' (selected) and 'Custom IP' (unselected) with an 'Update IP Address' button, 'Enable SNMPv3, Community String: public' (unchecked), and 'Enable remote syslog server' (unchecked). At the bottom, there are fields for Username (Admin) and Password (masked with dots). At the very bottom, there are buttons for 'APPLY CHANGES', 'RESET', and 'EXPORT SITE'.

Section	Item	Value/Status
SITE CONFIGURATION	Site Name	Default
	Country	United States
	Timezone	UTC-05:03 Eastern Time (US & Canada)

	SNMP	<input type="checkbox"/> Enable SNMPv3, Community String: public
Remote Logging	<input type="checkbox"/> Enable remote syslog server	
Device Authentication	Username: Admin Password: [masked]	

APPLY CHANGES RESET EXPORT SITE

Figure 142 – UniFi Site Configuration

Click on the Guest Control tab. Under the Access Control section, add:

192.168.3.0/24

to Pre-Authorization Access, then press Apply Changes. See Figure 143 –Unifi Guest Control.

This will allow devices on the Wifi Guest Network to (respond to) communications from the Home Network. Remember that the EdgeRouter has firewall rules prohibiting Guest network devices from initiating communications with the Home Network. This allows Guest devices to RESPOND to Home Network initiated conversations.

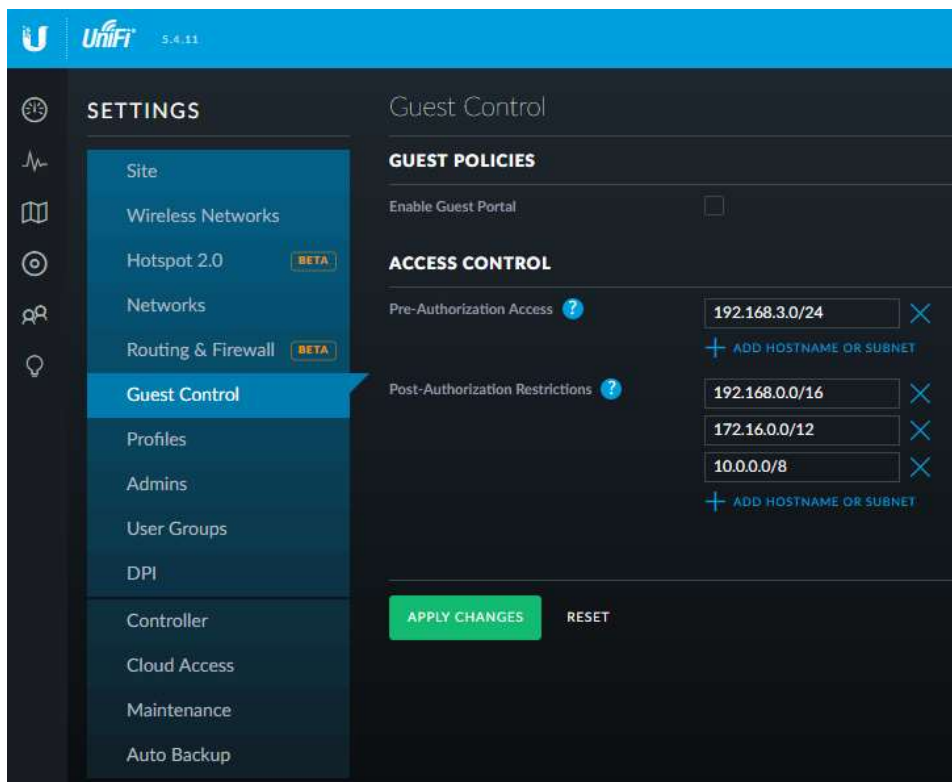

Figure 143 –Unifi Guest Control

Click on the User Groups tab, and then press Create New User Group. See Figure 144 – UniFi Initial User Groups.

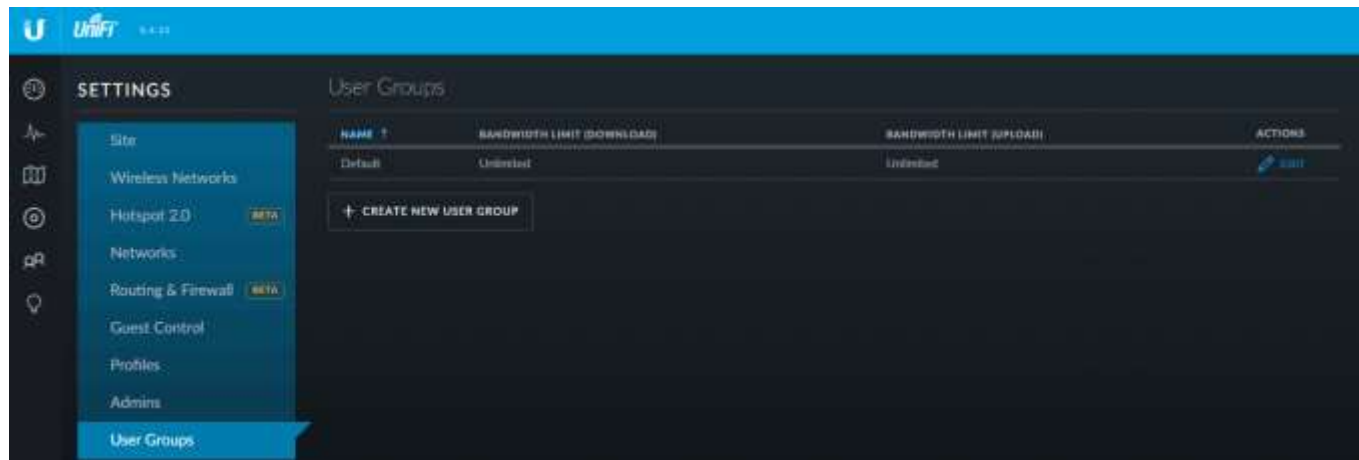

Figure 144 – UniFi Initial User Groups

The following settings allow the Access Point to limit the bandwidth used by users within the guest networks. You may choose to enter different limit values and/or leave either or both of the settings as unchecked. Unchecked is unlimited. The values used here are:

download speed is limited to 10 Mbps

upload speed is limited to 2 Mbps.

I believe that the limits are per user, not per network. Reference:

<https://community.ubnt.com/t5/UniFi-Wireless/User-Group-Bandwidth-limit-group-or-user/td-p/1828127>

To use the values that are in this guide, complete the form as follows:

Name	GuestGroup	
Bandwidth Limit (Download)	Checked	10000
Bandwidth Limit (Upload)	Checked	2000

then press Save. See Figure 145 – UniFi Guest Group

Figure 145 – UniFi Guest Group

You should now see the newly created group. See Figure 146 – UniFi New User Groups.

Figure 146 – UniFi New User Groups

Click on the Wireless Networks tab, you should see the Home Network that was setup earlier. See Figure 147 – UniFi Wireless Network Setup. Click on Create New Wireless Network button

Figure 147 – UniFi Wireless Network Setup

Click on Create New Wireless Network button. You will be presented with the Create New Wireless Network dialog. See Figure 148 – UniFi Create New Wireless Network.

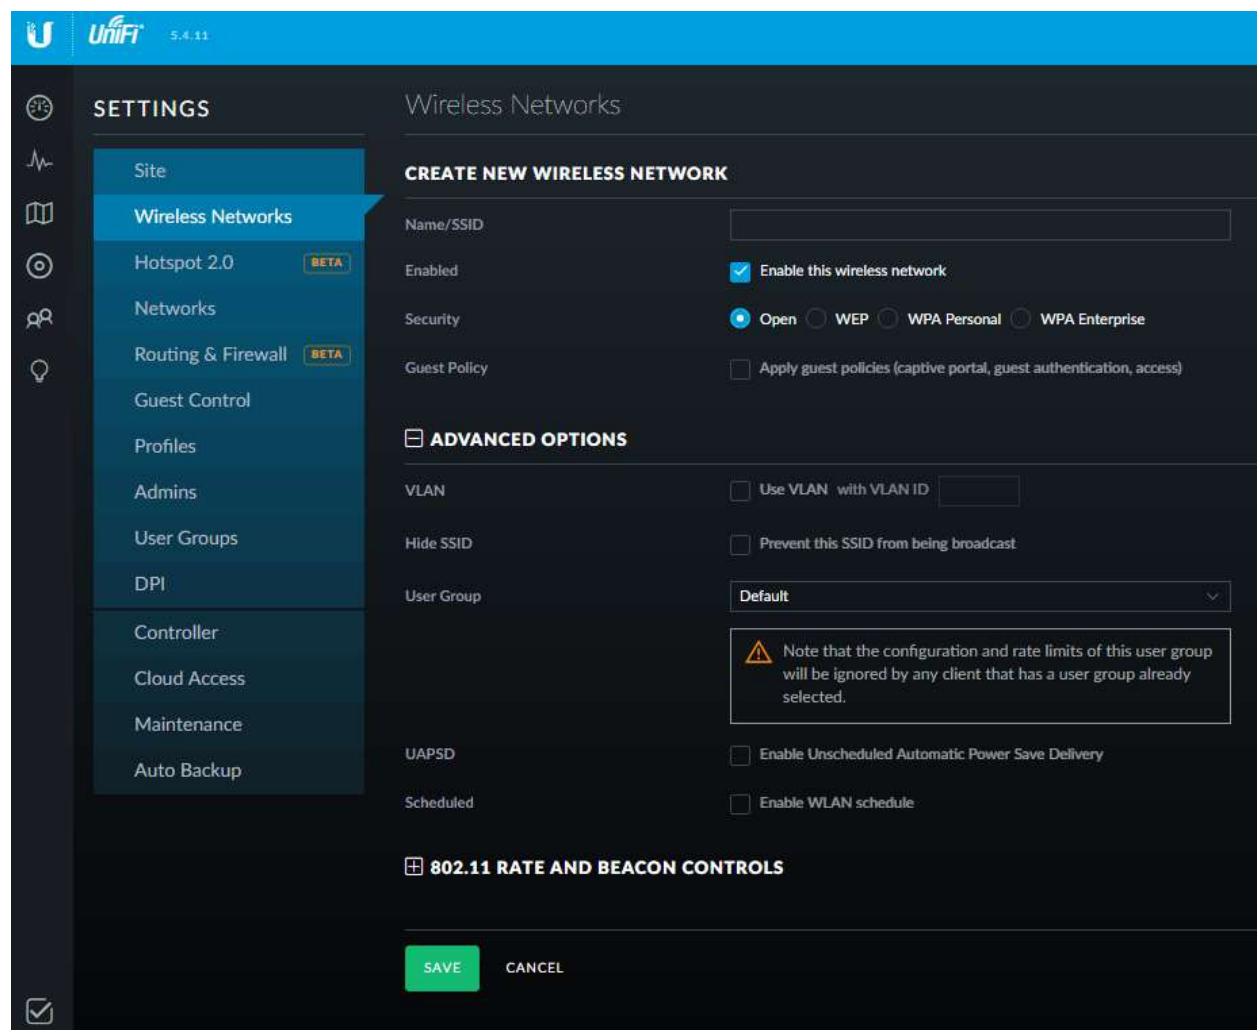

Figure 148 – UniFi Create New Wireless Network

Note that some people do not apply the guest policies on the GuestWifi and/or IoTWifi Networks, as they want individual WiFi devices on the Guest / IOT Networks to be able to access other Guest / IOT WiFi devices, respectively. Newer versions of the UniFi software have an additional checkbox “Multicast and Broadcast Filtering” (not shown), which also needs to be unchecked to enable the WiFi clients to communicate with each other. If Guest Policy is not checked, you might need to add more firewall rules to the ER-X, to maintain Network security, probably equivalent to Guest Control Post-Authorization Restrictions. See Figure 143 –UniFi Guest Control.

See also section 73 - Multicast DNS.

You can change the Name/SSID, Security Key (i.e. password) and WPA Modes as suites you.

Change / Enter the following information:

Name/SSID	GuestWifi		
Security	WPA Personal		
Security Key	<Enter your own password for the guest wifi network >		
Guest Policy	CHECKED	Apply guest policies	
VLAN	CHECKED	VlanId	6
WPA Mode	WPA2 Only	Encryption	AES/CCMP Only
User Group	GuestGroup		

Press Save. See Figure 149 – UniFi Guest Wif.

The screenshot shows the UniFi Settings interface. On the left is a sidebar with navigation options: Site, Wireless Networks (selected), Hotspot 2.0, Networks, Routing & Firewall, Guest Control, Profiles, Admins, User Groups, DPI, Controller, Cloud Access, Maintenance, and Auto Backup. The main content area is titled 'Wireless Networks' and 'EDIT WIRELESS NETWORK - GUESTWIFI'. It contains the following configuration fields:

- Name/SSID:** GuestWifi
- Enabled:** ☒ Enable this wireless network
- Security:** ☐ Open ☐ WEP ☒ WPA Personal ☐ WPA Enterprise
- Security Key:** [Redacted with dots]
- Guest Policy:** ☒ Apply guest policies (captive portal, guest authentication, access)
- ADVANCED OPTIONS:**
 - VLAN:** ☒ Use VLAN with VLAN ID 6
 - Hide SSID:** ☐ Prevent this SSID from being broadcast
 - WPA Mode:** WPA2 Only
 - Encryption:** AES/CCMP Only
 - User Group:** GuestGroup
- 802.11 RATE AND BEACON CONTROLS:**
 - UAPSD:** ☐ Enable Unscheduled Automatic Power Save Delivery
 - Schedule:** ☐ Enable WLAN schedule

At the bottom, there is a warning box: "Note that the configuration and rate limits of this user group will be ignored by any client that has a user group already selected." Below this are 'SAVE' and 'CANCEL' buttons.

Figure 149 – UniFi Guest Wif

Click on Create New Wireless Network button.

You can change the Name/SSID, Security Key (i.e. password) and WPA Modes as suites you.

Change / Enter the following information:

Name/SSID	lotWifi		
Security	WPA Personal		
Security Key	<Enter your own password for the iot wifi network >		
Guest Policy	CHECKED	Apply guest policies	
VLAN	CHECKED	VlanId	7
WPA Mode	WPA2 Only	Encryption	AES/CCMP Only
User Group	GuestGroup		

Press Save. SeeFigure 150 – UniFi lot WiFi.

The screenshot shows the UniFi Settings interface for a wireless network named 'lotWifi'. The left sidebar contains a 'SETTINGS' menu with options like Site, Wireless Networks, Hotspot 2.0, Networks, Routing & Firewall, Guest Control, Profiles, Admins, User Groups, DPI, Controller, Cloud Access, Maintenance, and Auto Backup. The main content area is titled 'Wireless Networks' and 'EDIT WIRELESS NETWORK - IOTWIFI'. It includes fields for Name/SSID (lotWifi), Enabled (checked), Security (WPA Personal), Security Key (masked), Guest Policy (checked), VLAN (checked with ID 7), Hide SSID (unchecked), WPA Mode (WPA2 Only), Encryption (AES/CCMP Only), and User Group (GuestGroup). There are also checkboxes for UAPSD and a scheduled WLAN schedule. A warning box notes that the configuration and rate limits of the selected user group will be ignored by any client that has a user group already selected. At the bottom, there are 'SAVE' and 'CANCEL' buttons.

Figure 150 – UniFi lot WiFi

You should now have the following networks. Note that:

GuestWifi	Checked as Guest	Vlan 6
HomeNet	(Unchecked Guest)	(no Vlan)
IoTWifi	Checked as Guest	Vlan 7

See Figure 151 – UniFi Three WiFi Networks.

Figure 151 – UniFi Three WiFi Networks

Click on the DPI tab, and set:

Enable Deep Packet Inspection (DPI) On

Press Apply Changes. See Figure 152 – UniFi Deep Packet Inspection

Figure 152 – UniFi Deep Packet Inspection

Return to the Dashboard screen by pressing the Dashboard button. See Figure 153 – UniFi Dashboard Button.

Figure 153 – UniFi Dashboard Button

In the upper right part of the dashboard screen is the Open Properties button. Press the button. See Figure 154 – UniFi Open Properties Button

Figure 154 – UniFi Open Properties Button

These are the Properties of the access point. There are some nice settings in here. See Figure 155 – UniFi Access Point Properties.

Figure 155 – UniFi Access Point Properties.

68. UniFi Configuration Backup

Find the Settings button, near the lower left side of the screen, and press it. See Figure 141 – Settings Button. You should see the Maintenance Tab of the Settings page. Press it. Reference Figure 156 – UniFi Maintenance Screen.

Figure 156 – UniFi Maintenance Screen

In the middle of this screen is a BACKUP section. I have changed my backup setting to be 'Settings only'. Press the 'DOWNLOAD BACKUP' button and store the resultant file. This is your access point configuration backup.

You can now exit the UniFi browser and close the UniFi Controller Software by pressing the X in the upper-right corner, as shown in Figure 123 – UniFi Controller Software Running.

This is the end of the Access Point / UniFi setup.

The following sections are additional EdgeRouter configuration steps.

69. Timed Based Firewall Rules

Several people have wanted to restrict their children's Internet usage based upon time. Here are some sample links:

<https://community.ubnt.com/t5/EdgeMAX/Restrict-WAN-Access-to-from-LAN-Clients-by-Specific-IP-By-Time/td-p/2083140>

<https://community.ubnt.com/t5/UniFi-Wireless/User-based-time-control-of-wifi-access/td-p/1490803>

<https://community.ubnt.com/t5/EdgeMAX/Time-control-parental-controll/td-p/1035259>

<https://community.ubnt.com/t5/EdgeMAX/Set-up-time-limits-for-kids-internet-access/td-p/1824135>

<https://community.ubnt.com/t5/EdgeMAX/Parental-controls-time-of-day-routing-content-filtering/td-p/1268520>

70. Double-NAT

When one firewall/router is behind another firewall/router, that combination is called double-NAT. Each router performs Network-Address-Translation (NAT.) Each router will introduce a small time delay as it processes IP packets. If you are running a server behind your (inner) router, then Double NAT can be particularly difficult to configure. Most people in the Ubiquiti forums hate Double-NAT.

Once the EdgeRouter 's firewall has been enabled / configured, the EdgeRouter CAN (but does not have to) be your main and only router. Remember to replace and then remove the default 'ubnt' login before using the ER-X as your internet facing router.

71. Configuring a Second / Testing ER-X

It is handy to have a second, already-configured, ER-X on hand as a cold spare. If you are considering using "Adblocking and Blacklisting" from section 75, you could configure one ER-X with and one ER-X without Adblocking. Testing that feature is now as easy as the five minutes it takes to swap routers.

To configure a Second/ Testing ER-X, it is important that the IP address presented to the WAN port NOT be within one of our internal IP address ranges. Reference section 4 - EdgeRouter IP Address Use and Table 1 - Table of Networks for that data.

One way of presenting a different IP address to the Second / Testing ER-X, is to insert your leftover consumer router (with its LAN configured for 192.168.[0,1,2].X) before your Second / Testing ER-X router.

See Figure 157 – Second / Testing ER-X Wiring.

Figure 157 – Second / Testing ER-X Wiring

72. Another link

This seems like a wealth of information:

<http://wiki.indie-it.com/wiki/Ubiquiti>

73. Multicast DNS

The use of MDNS between Networks, was suggested in <https://github.com/mjp66/Ubiquiti/issues/29> with a link of: <https://www.youtube.com/watch?v=1mjdkki2pIY>

I believe MDNS allows device discovery between two or more Networks by merging the Networks' broadcast traffic. I don't know what security implications this merging might have. I have tried enabling MDNS within the ER-X, but have not fully investigated it. MDNS can be enabled via the CLI or via the Config Tree. To enable via the Config Tree, open up the service -> mdns -> repeater sub-menus. Enter in your interfaces, and then click Preview. See Figure 158 – MDNS Setup Example.

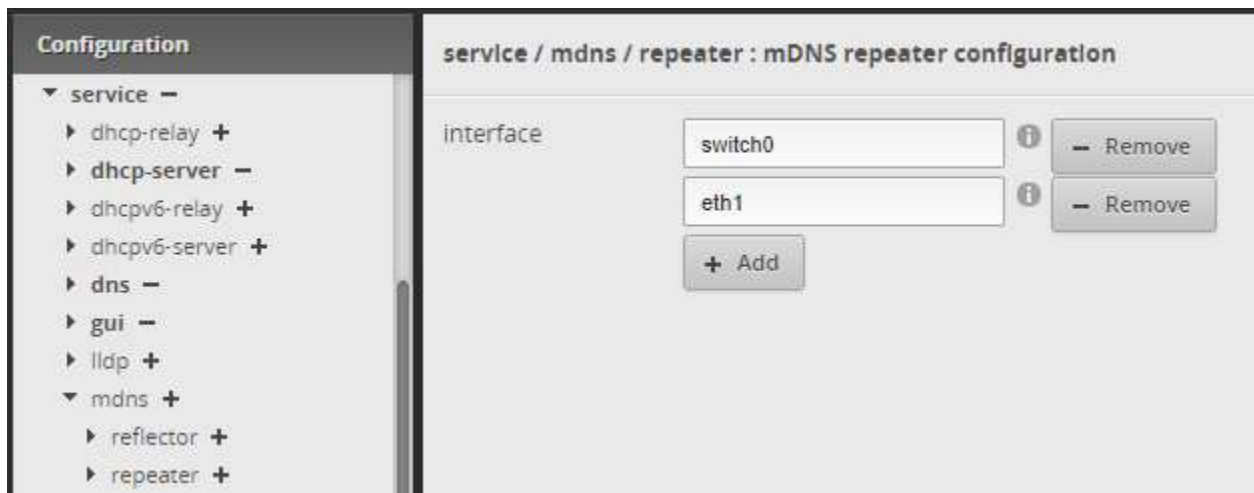

Figure 158 – MDNS Setup Example.

While trying to determine the impact of mdns, I had trouble disabling this feature via the Config Tree, so I used the following commands via the command line interface to disable this service.

```
configure
delete service mdns repeater
commit
save
exit
```

It appears that enabling Multicast DNS is also available within the UniFi (Access Point) system.

Reference the following link:

<https://community.ubnt.com/t5/UniFi-Routing-Switching/USG-and-Chromecast-across-subnets-VLANs-Multicast-or-mDNS/td-p/1782140>

Within that article is the following post:

<https://community.ubnt.com/t5/UniFi-Routing-Switching/USG-and-Chromecast-across-subnets-VLANs-Multicast-or-mDNS/m-p/2016844/highlight/true#M53023>

More investigation is needed.

See also the following posts:

<https://community.ubnt.com/t5/EdgeRouter/mDNS-bonjour-forwarding/td-p/414093/>

<https://community.ubnt.com/t5/EdgeRouter/mDNS-forwarding-so-that-iPhone-can-communicate-with-iTunes-on-a/m-p/1752138/>

74. Reserving Device Addresses via DHCP

When you have the ER-X reserve a DHCP address for a device, that device will always be presented with the same IP address. This is useful for devices like servers. This is different than “fixing” a device’s IP. Fixing usually involves configuring the device itself, to use a certain IP address. Reserving addresses has the added benefit that the rest of the DHCP settings continue to be presented to the device. Static mapping is another term for reserving.

Ensure your device is powered on and connected to the Network you wish.

To reserve an IP address, select the “Services” button. Reference Figure 51 – Services Button. Ensure that the “DHCP Server” tab is selected. Reference Figure 52 – DHCP Server Screen. Find the correct DHCP line for your Network, follow it to the right side, to the line’s “Actions” button. Click the “Actions” button. You will be presented with a list of actions. Choose “View Leases”, See Figure 159 – View Leases Button.

Figure 159 – View Leases Button.

You will be presented with a DHCP Server Dialog. This dialog will contain a list of your devices which have acquired a dynamic DHCP lease. See Figure 160 – DHCP Server Leases Dialog.

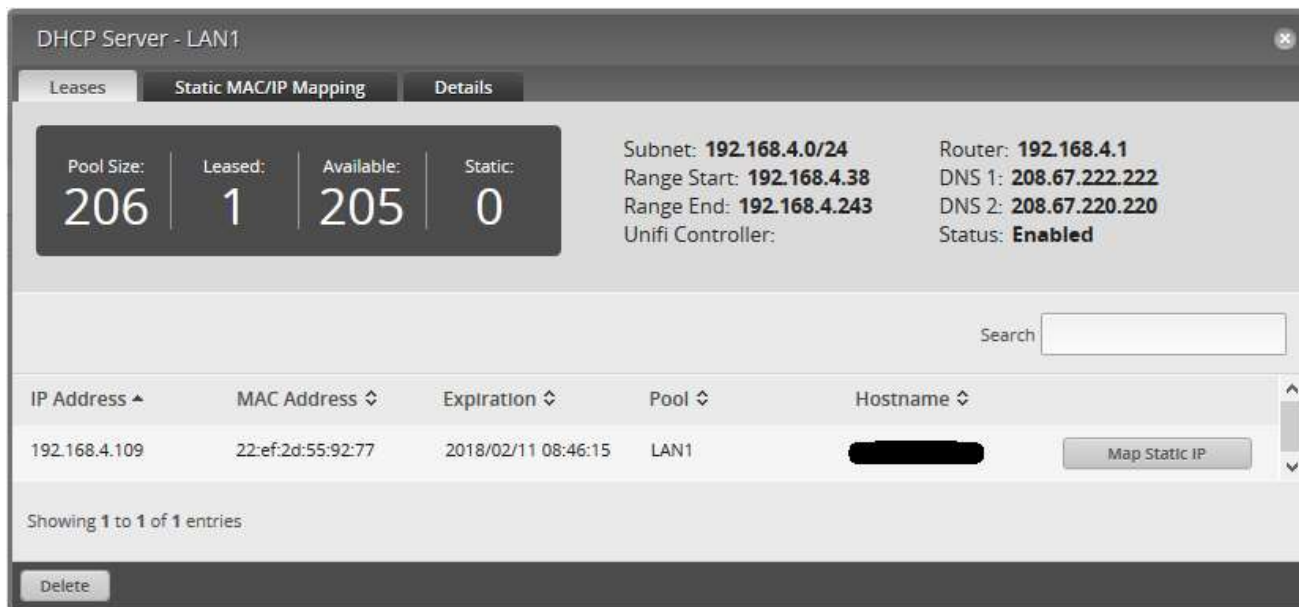

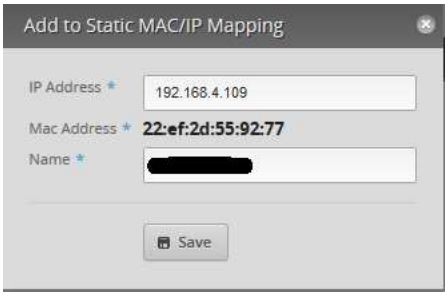

Figure 160 – DHCP Server Leases Dialog.

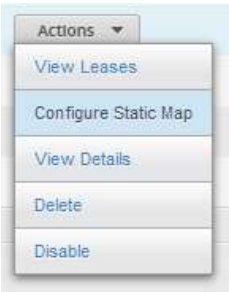

To reserve an IP address for that device, Press the “Map Static IP” button near the right side of the screen, for the correct device. You will be presented Figure 161 – Static IP Mapping Dialog.

The dialog box titled "Add to Static MAC/IP Mapping" contains three input fields: "IP Address" with the value "192.168.4.109", "Mac Address" with the value "22:ef:2d:55:92:77", and "Name" which is currently empty. A "Save" button is located at the bottom right of the dialog.

Figure 161 – Static IP Mapping Dialog.

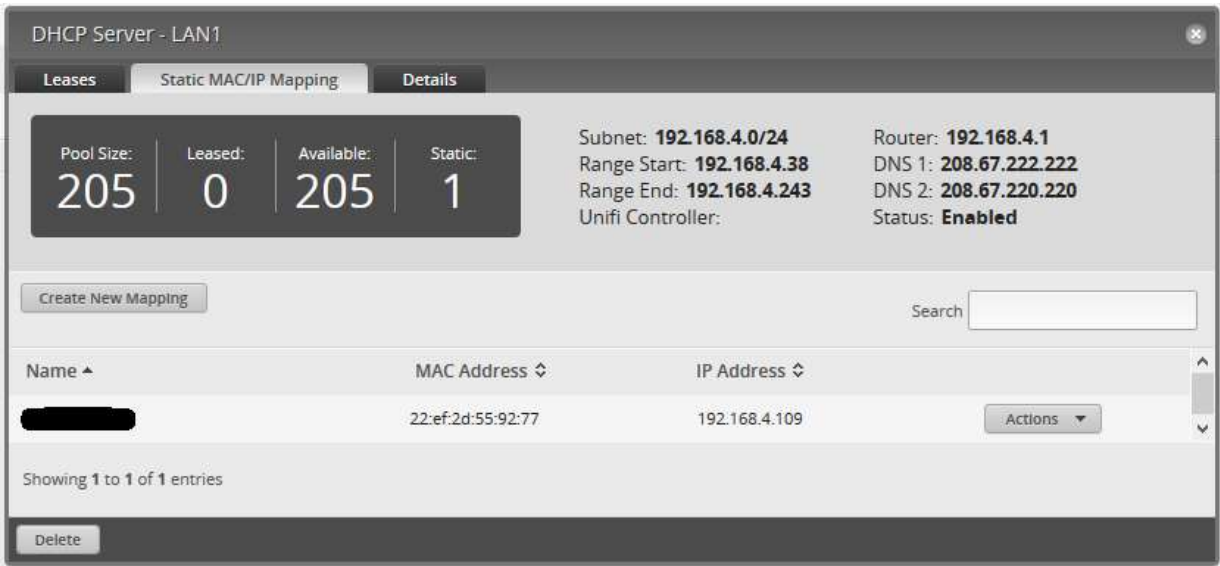

You can modify the IP address to a different one or just leave it. If you modify it, only change the last octet (the last number.) Press “Save”, then close the DHCP Server Leases dialog. If you modified the presented IP address, you will need to “release” and “renew” the devices IP address and/or reboot that device now. To view static IP reservations, find the Actions button, and click the “Configure Static Map” button. See Figure 162 – Configure Static Map Button.

The Actions dropdown menu is open, showing five options: "View Leases", "Configure Static Map", "View Details", "Delete", and "Disable". The "Configure Static Map" option is highlighted in blue.

Figure 162 – Configure Static Map Button.

You will be presented with a list of reserved IP addresses for the chosen DHCP server. See Figure 163 – Static IP Mapping Dialog.

The "DHCP Server - LAN1" dialog box has three tabs: "Leases", "Static MAC/IP Mapping" (which is active), and "Details". The "Static MAC/IP Mapping" tab shows a summary of the static mappings: Pool Size: 205, Leased: 0, Available: 205, and Static: 1. Below this is a "Create New Mapping" button and a search bar. A table lists the static mappings with columns for Name, MAC Address, and IP Address. One entry is shown with a redacted name, MAC address 22:ef:2d:55:92:77, and IP address 192.168.4.109. An "Actions" button is next to the entry. At the bottom, it says "Showing 1 to 1 of 1 entries" and there is a "Delete" button.

Name	MAC Address	IP Address
[Redacted]	22:ef:2d:55:92:77	192.168.4.109

Figure 163 – Static IP Mapping Dialog.

75. Adblocking and Blacklisting

This is optional. This seems to work flawlessly.

You should note before implementing this section that some web sites / web pages you may wish to visit will be blocked by this code. In some cases you may not be able to determine which URLs in the blocking lists are blocking which sites / page you want to visit, as some website links 'redirect' through advertisers' sites. These advertisers' sites will now be blocked.

There are a number of similar posts with different version numbers. I had to use an SSH package (e.g. putty for Windows) to paste the following commands into the EdgeRouter, as the CLI doesn't seem to support copy / paste.

Reference: <https://community.ubnt.com/t5/EdgeMAX/DNS-Adblocking-amp-Blacklisting-dnsmasq-Configuration/td-p/2215008>

The following text is cached from the above URL when the code was at V1.1.6.3 (you should check for updated information and use the newest code and any newer directions :)

First ensure the router has enough space (2 lines):

```
sudo apt-get clean cache
delete system image
```

Installation (2 lines):

```
curl -L -O https://raw.githubusercontent.com/britannic/blacklist/master/edgeos-
dnsmasq-blacklist_1.1.6.3_mipsel.deb
sudo dpkg -i edgeos-dnsmasq-blacklist_1.1.6.3_mipsel.deb
```

Removal (1 line):

```
sudo apt-get remove --purge edgeos-dnsmasq-blacklist
```

Upgrade:

Since dpkg cannot upgrade packages, follow the instructions under Installation and the previous package version will be automatically removed before the new package version is installed

There is much more listed at this post.

When I installed this, I saw the following line: Total entries extracted 98158.

An associated (similar) posting is at: <https://github.com/britannic/blacklist>

There is also an associated project located at: <https://github.com/britannic/pixelserv> (which I have not tried.)

Reference the following from his post:

dnsmasq may need to be configured to ensure blacklisting works correctly

Here is an example using the EdgeOS configuration shell

```
configure
set service dns forwarding cache-size 2048
set service dns forwarding except-interface [Your WAN i/f]
set service dns forwarding name-server [Your choice of IPv4 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv4 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv6 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv6 Internet Name-Server]
set service dns forwarding options bogus-priv
set service dns forwarding options domain-needed
set service dns forwarding options domain=mydomain.local
set service dns forwarding options enable-ra
set service dns forwarding options expand-hosts
set service dns forwarding options localise-queries
set service dns forwarding options strict-order
set service dns forwarding system
set system name-server 127.0.0.1
set system name-server ':::1'
commit; save; exit
```

For testing, I picked a well-known advertisement site owned by Google. I tried and couldn't get there.

Thanks to [@britannic](#) for this.

Also reference <https://github.com/britannic/blacklist#frequently-asked-questions> especially the section titled "EdgeOS dnsmasq Configuration". This appears to be the same text as above.

76. What devices should be placed on which Network?

Some devices could go either on the Home Network or on the lot Network.

I'll use an Amazon Echo as the first example. The echo can execute just fine from the lot Network. The echo typically uses a smart phone app to control it. Since Amazon's phone app doesn't have a place to enter the echo's IP address, then both the phone and the echo need to be on the same Network. If you want the echo to live on the lot network, then you will need to temporarily connect your phone / switch your phone to the lot network to control the echo. Note this method won't work for Wired lot devices.

The echo could also be placed on the Home Network. Since the echo gets regular updates from Amazon, and Amazon is, presumably, smart enough to keep their device secure, I don't see having this device on the Home Network as a real problem.

Then there are devices I would NOT let on my Home Network. These are devices which don't receive firmware updates, devices which likely connect to some web service, or devices which ultimately come from Chinese manufacturers. My examples of these devices would be Baby Monitors / Security Cameras / the proverbial "Light Bulb" / etc... Who knows what is happening inside these devices firmware? Are there hard coded logins-passwords / open telnet ports / etc...? Hackers may be able to easily penetrate these devices, and then they are inside the Network these devices are connected to.

If you can't tell or test the security of a device, if it is not being actively updated, or if it is from some unknown manufacturer, I'd put that device on the lot Network. To me, these types of devices are not worth the risk of having them on my Home Network, right alongside my household personal computers.

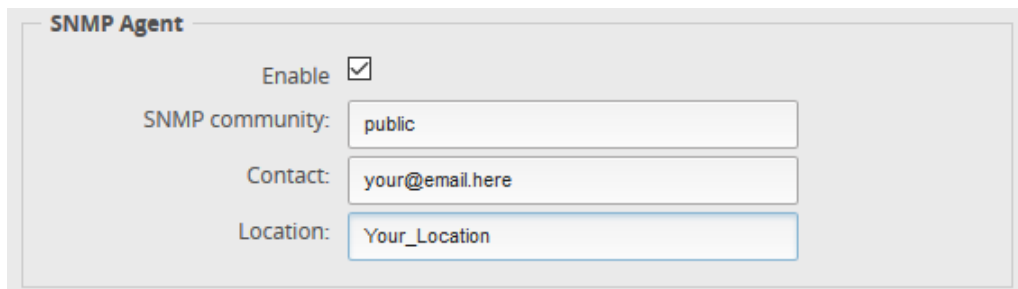

This is ultimately a convenience vs security trade off. Choose carefully. By even having an lot network, you can now choose which Network to put your stuff onto.

This is from a discussion at <https://github.com/mjp66/Ubiquiti/issues/18>

77. Simple Network Management Protocol (SNMP)

To enable the ER-X to be a source of SNMP data, first press the “System” button. Reference Figure 9 – System Button. Find the SNMP Agent section, fill-in the three fields, and check Enable. Press “Save”. See Figure 164 – Sample SNMP configuration.

The ER-X appears to support both version 1 and version2(c). Version 2 supports 64 bit counters. The only security available is to change the SNMP community string to something hard to guess. Most installations assume “public”.

A screenshot of a web-based configuration form titled "SNMP Agent". The form is enclosed in a light gray border. It contains four fields: "Enable" with a checked checkbox, "SNMP community:" with a text box containing "public", "Contact:" with a text box containing "your@email.here", and "Location:" with a text box containing "Your_Location".

SNMP Agent	
Enable	<input checked="" type="checkbox"/>
SNMP community:	public
Contact:	your@email.here
Location:	Your_Location

Figure 164 – Sample SNMP configuration.

There is a huge list of SNMP programs which could monitor you router. Some I have seen referenced are:

Snmwalk	(Referenced in Appendix C)
Cacti	
NetworX / LibreNMS / PRTG	
Nagips / Zabbix / Dude	
OpenNMS	
MRTG	
Grafana / InfluxDB / Telegraf	(See Appendix C)

78. Coalescing the Wired lot and Wifi lot Networks

This optional section allows the coalescence of the Wired lot and Wifi lot Networks. This involves enabling switch0 to be VLAN Aware. When configuring switch0 to be VLAN Aware, it is important to NOT be connected to an Edgerouter port which is using switch0. I used the Wired Separate Network (which is not in switch0) for these re-configuration steps. I locked myself out of my ER-X EdgeRouter (and had to factory reset / reload the base configuration) about 4 times while researching and writing this section.

Remember that the Wifi lot Network is setup as a Guest Network, isolating the WiFi clients from each other. If you would like the WiFi clients to be able to communicate with each other, then you will need to uncheck 'Guest Policy' for the WiFi lot Network. Reference the section near Figure 150 – UniFi lot WiFi. Newer versions of the UniFi software have an additional checkbox "Multicast and Broadcast Filtering" (on the same dialog), which needs to be unchecked to enable the WiFi clients to communicate with each other.

If you disable guest control, you may need to add additional ER-X firewall rules to maintain security, probably equivalent to Guest Control Post-Authorization Restrictions. See Figure 143 –UniFi Guest Control.

I have done limited testing with this configuration, so I still consider this to be experimental for Home Usage.

Login to EdgeRouter

The following allows the Wired Separate Network to access the EdgeRouter itself.

```
Firewall/NAT
  Firewall Policies
    WIRED_SEPARATE_LOCAL -> Actions -> Configuration
      Default Action: Accept
      Save Ruleset
```

Disconnect your computer's Ethernet cable from eth3 / Home Network. Wait 5 to 10 seconds. Re-connect your computer's Ethernet cable to eth2 / Wired Separate Network.

Open a new Browser window/tab and enter a URL of 192.168.5.1 and Login to the EdgeRouter

Now we are connected to the EdgeRouter without using switch0.

Move the Home Network Address setup from switch0 to vid 1.

```
Dashboard
  Home Net switch0 -> Actions -> Config
    Vlan Tab
      Address:      No address

Dashboard
  Add Interface
    Add VLAN
      VLANID:      1
      Interface:    switch0
      Description:  Home Net
      MTU:          1500
      Address:      Manually define IP Address
                    192.168.3.1/24
```

Remove the address range from Wired Iot Network.

```
Dashboard
  Wired Iot Net / eth1 -> Actions -> Config
    Address:          No address
```

Remove firewall rules from Wired Iot Network.

```
Firewall/NAT
  Firewall Policies
    WIRED_IOT_LOCAL -> Actions -> Edit Ruleset
      Rules Tab
        Rule 2-> Action -> Delete Rule
        Rule 1-> Action -> Delete Rule
      Interfaces Tab
        Set Interface --
        Set Direction --
    WIRED_IOT_LOCAL -> Actions -> Delete Ruleset
```

Delete the Wired Iot Network DHCP server.

```
Services
  DHCP Server
    WiredIotDHCP
      Actions Delete
```

Move Home Network firewall rules from switch0 to vid 1

```
Firewall/NAT
  Firewall Policies
    HOME_OUT Actions -> Interfaces
      Interfaces: switch0.1
```

Enable switch0 to be Vlan Aware.

Note that I connect my Access Point to eth4, so I could have, but didn't add "vid 6, 7" to eth3.

```
Dashboard
  Switch0 Config
    Vlan
      Vlan Aware Enable checked
      eth1 checked
      (Click Config Tab, then Click Vlan tab to refresh the dialog / size)
      eth1 pvid 7
      eth3 checked
      eth3 pvid 1
      eth4 checked
      eth4 pvid 1
      eth4 vid 6, 7
```

The following restores the Wired Separate Network firewall restrictions.

```
Firewall/NAT
  Firewall Policies
    WIRED_SEPARATE_LOCAL -> Actions -> Configuration
      Default Action: Drop
      Save Ruleset
```

You may want to rename the “Wifi lot” / “Wired lot” items to simply be “lot” items.

79. Intrusion Detection Systems

QUESTION: Which one to pick? How to configure it / connect it to the EdgeRouter?

@BuckeyeNet suggests Security Onion. Security Onion is at <https://securityonion.net/> and <https://github.com/security-onion-solutions/security-onion/wiki/IntroductionToSecurityOnion>

Seems to be rather involved. I have not tried Security Onion yet.

80. Conclusions

I hope that this guide helped you set up your Ubiquiti equipment, and that you have learned a lot.

Enjoy your new network.

-Mike

Appendix A. TP-Link TL-SG105EV2 Switch Setup

This section has nothing to do with the ER-X setup. This section is related to Method 1 of section 10, for using multiple UAPs.

[Note I also tried a TP-Link TL-SG105 (Ver 2.1) UN-managed Gigabit switch, and it also worked. I am amazed. Maybe Gigabit switch chips are now designed to pass (the larger) VLAN frame data automatically, I don't know. This makes the rest of this section pretty much academic.]

The inexpensive Netgear switches should also work, I just happened to have Tp-Link models available for use. I believe these switches will need a hardware version of V2 or above to operate correctly. These directions are approximate.

I configured an additional AP-AC-LR Ubiquiti Access Point by referencing the “General” portion of section 10, and then following sections 62 through 67 for this additional UAP.

I connected the Tp-Link switch to my computer which was configured with a fixed address of 192.168.1.10. Reference section 7 for how to configure a computer's Ethernet port. Using the Tp-Link software, I then configured this switch to have a specific 192.168.3.X address. After saving the configuration, I re-configured my computer back to DHCP, and re-connected the computer to the Home Network. I also connected the new switch to the Home Network. I then made a static reservation within the ER-X for this switch.

For this example, I will use and connect two UAPs to this switch. I choose port 4 and port 5 for those UAP connections. I also choose port 1 of this switch to connect to the ER-X's eth4 port.

Using the Tp-Link software, I selected the VLAN / 802.1Q VLAN page. See Figure 165 – Tp-Link Initial 802.1Q Dialog.

Figure 165 – Tp-Link Initial 802.1Q Dialog.

On the VLAN page, enable the Global Config.

Reference Table 1 - Table of Networks for the VLAN Networks used for this project. Enter the following information into the VLAN Page:

- VLAN: 6
- VLAN Name: WiFiGuest
- Tag the ports: 1, 4, 5

See Figure 166 – Tp-Link VLAN 6 Configuration.

Press Apply

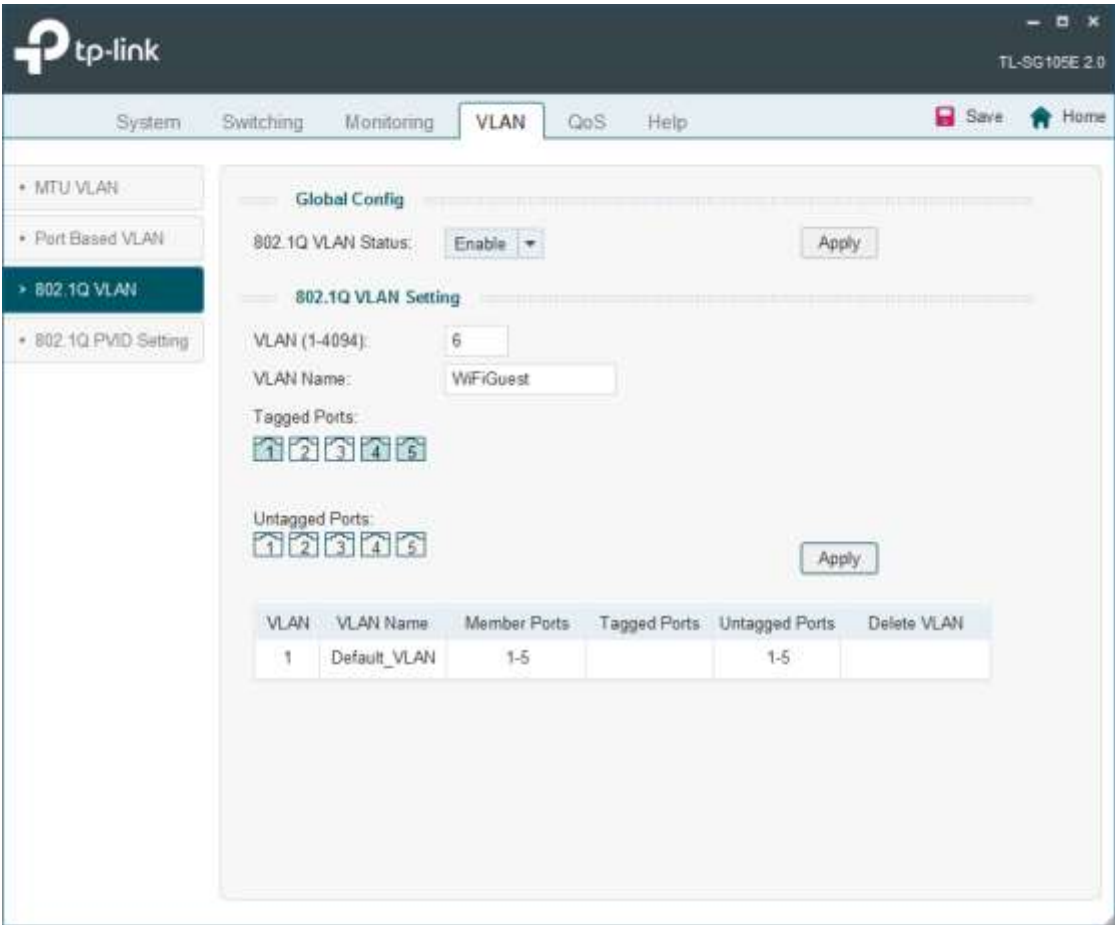

Figure 166 – Tp-Link VLAN 6 Configuration.

Enter the following information into the VLAN Page:

VLAN: 7

VLAN Name: WiFilot

Tag the ports: 1, 4, 5

See Figure 167 – Tp-Link VLAN 7 Configuration.

Press Apply.

The screenshot shows the Tp-Link web interface for a TL-SG105E 2.0 switch. The 'VLAN' tab is selected in the top navigation bar. On the left sidebar, the '802.1Q VLAN' option is highlighted. The main configuration area is divided into two sections: 'Global Config' and '802.1Q VLAN Setting'. In the 'Global Config' section, the '802.1Q VLAN Status' is set to 'Enable'. In the '802.1Q VLAN Setting' section, the 'VLAN (1-4094)' is set to '7', the 'VLAN Name' is 'WiFilot', and the 'Tagged Ports' are 1, 4, and 5. The 'Untagged Ports' are 1, 2, 3, 4, and 5. An 'Apply' button is present at the bottom right of the configuration section. Below the configuration section is a table of existing VLANs.

VLAN	VLAN Name	Member Ports	Tagged Ports	Untagged Ports	Delete VLAN
1	Default_VLAN	1-5		1-5	
6	WiFiGuest	1, 4-5	1, 4-5		Delete

Figure 167 – Tp-Link VLAN 7 Configuration.

When you are finished, your screen should look like Figure 168 – Tp-Link VLAN Final Configuration.
Press Save in the upper right.

Figure 168 – Tp-Link VLAN Final Configuration.

After this configuration, I disconnected this switch from the Home Network. I disconnected the original UAP from the ER-X eth4 port.

I then connected port 1 of the Tp-Link switch to the ER-X's eth4 port. I connected one UAP (via its Power Over Ethernet (POE) adapter) to the Tp-Link switch port 4 and the other UAP, via its POE, to the Tp-Link switch port 5. See Figure 169 – Multiple Access Point Wiring. Also reference section 61 and Figure 110 – Access Point Wiring. I did nothing with the Tp-Link switch ports 2 and 3.

Figure 169 – Multiple Access Point Wiring.

For testing purposes, I configured each of my two UAPs with differently-named-sets of SSIDs. This way I could control and test which UAP I was actually connecting to.

Appendix B. Multimedia over Coax Alliance (MOCA)

This section has nothing to do with the ER-X setup; this is just general networking information.

If your house is wired for television coax i.e. "Cable TV" and you do not have satellite TV, you might be able to use Multimedia over Coax Alliance (MOCA) adapters as an alternative to direct Ethernet cabling. This could be useful if you want to place your UAP in the center of your house, and don't have / can't wire direct Ethernet cabling to that location from your router. These could also be used to position a second UAP at that far end of a house, where you can't run any Ethernet wires.

A MOCA adapter will re-broadcast Ethernet traffic over Cable TV wires to another MOCA adapter. You need at least two MOCA adapters to network together. These adapters can concurrently operate over coax wires which are carrying Cable TV signals. If you use these adapters, you will also want to install a Point of Entry (POE) filter, so that your MOCA signals don't contaminate the Cable TV provider's network, i.e. your neighborhood.

A friend of mine had trouble streaming WiFi data to his television set, which was at the far end of his house from his router. He purchased two MOCA adapters to Ethernet connect his Television to his router. He has had no problems and has since purchased two more adapters to provide more Ethernet drops in his house.

You will want at least version 2.0 adapters. You will need MOCA adapters which support 802.1Q if you will be using them to connect UAPs to your ER-X. A pair of these adapters seems to be about U.S. \$170. That's pretty expensive, but might be worth it, if your only other alternative is (typically unreliable) Power-line Ethernet adapters.

https://en.wikipedia.org/wiki/Multimedia_over_Coax_Alliance

Appendix C. Monitoring an EdgeRouter via SNMP with Grafana running on a Raspberry Pi

This section has nothing to do with the ER-X setup.

=====

Appendix C - Part 1

The following directions will show how to install and configure Grafana, InfluxDB, and Telegraf on a Raspberry Pi, for monitoring EdgeRouter statistics. Preview pictures are available in one of the below links.

The heavy lifting on this project was done by @waterside. Here are the major references:

<https://github.com/WaterByWind/grafana-dashboards>

<https://github.com/WaterByWind/grafana-dashboards/tree/master/UBNT-EdgeRouter>

<https://grafana.com/dashboards/1756> (with pictures)

<https://community.ubnt.com/t5/UniFi-Wireless/Grafana-dashboard-for-UniFi-APs-now-available/td-p/1833532>

Most of the following items will be performed in a command terminal, so you will need to be generally familiar with RaspberryPi / Linux / Rasbian to continue. You will need to enable SNMP on the ER-X, Reference section 77 - Simple Network Management Protocol (SNMP).

To enable the Grafana web page to be remotely accessed by computers other than the Pi (i.e. accessed via PCs on the HomeNetwork), the Pi running these tools will need to be assigned a reserved IP address. Reference section 74 - Reserving Device Addresses via DHCP, for how to do this. Since the Pi is relatively slow, I suggest not browsing directly on the Pi, after the initial setup.

Start with Rasbian Stretch. I used a 32Gig micro SD card, as I expect to collect a lot of data over time.

Configure Pi

Menu -> Preferences -> Raspberry Pi Configuration

Localization Tab

Set Locale

Set Timezone

Set Keyboard

Set WiFi Country

(You may also want to enable the following)

Interfaces Tab

SSH: Enable

VNC: Enable

Update PI Operating System

```
sudo apt-get update
```

```
sudo apt-get upgrade
```

Install SNMP and associated tools

```
sudo apt-get install snmp
```

```
sudo apt-get install snmpd
```

```
sudo apt-get install dnsutils
```

Test ER-X's SNMP setup by issuing:

```
snmpwalk -v2c -c public 192.168.3.1
```

You should see a lot of data, most of it starting with "iso".

Download binaries

Go to <https://www.influxdata.com/>

(The depiction below is what I saw and the commands which I copied from the website and then ran.)

(You will want to check for and use updated instructions / versions / commands.)

(The wget commands are one long line, which is wrapped within this document.)

Select Download tab

Select Telegraf (v1.5.2) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/telegraf/releases/telegraf-1.5.2_linux_armhf.tar.gz
tar xvfz telegraf-1.5.2_linux_armhf.tar.gz
```

Select InfluxDB (v1.4.3) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/influxdb/releases/influxdb-1.4.3_linux_armhf.tar.gz
tar xvfz influxdb-1.4.3_linux_armhf.tar.gz
```

Select Chronograf (v1.4.2.1) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/chronograf/releases/chronograf-1.4.2.1_linux_armhf.tar.gz
tar xvfz chronograf-1.4.2.1_linux_armhf.tar.gz
```

Install (copy) binaries per

<https://community.influxdata.com/t/installing-on-a-raspberry-pi/2159>

(You will want to adjust directory names for your specific versions.)

```
cd telegraf
sudo cp -rp usr/* /usr
sudo cp -rp etc/* /etc
sudo cp -rp var/* /var
cd ..
```

```
cd influxdb-1.4.3-1
sudo cp -rp usr/* /usr
sudo cp -rp etc/* /etc
sudo cp -rp var/* /var
cd ..
```

```
cd cronograf-1.4.2.1-1
sudo cp -rp usr/* /usr
sudo cp -rp etc/* /etc
sudo cp -rp var/* /var
cd ..
```

Put the following text into:

```
/etc/systemd/system/influxdb.service
```

```
[Unit]
Description=InfluxDB service
After=network.target
[Service]
ExecStart=/usr/bin/influxd
Restart=always
[Install]
WantedBy=multi-user.target
```

Start the service (now) with the following command:

```
sudo systemctl start influxdb.service
```

Check that the service is running with:

```
systemctl | grep influx
```

Auto start the service (after re-boots) with the following command:

```
sudo systemctl enable influxdb.service
```

Put the following text into:

```
/etc/systemd/system/telegraf.service
```

```
[Unit]
Description=Telegraf service
After=network.target
[Service]
ExecStart=/usr/bin/telegraf -config /etc/telegraf/telegraf.conf
Restart=always
[Install]
WantedBy=multi-user.target
```

Note that the ExecStart is really one long line, upto the Restart line. It may be wrapped within this document.

Start the service (now) with the following command:

```
sudo systemctl start telegraf.service
```

Check that the service is running with:

```
systemctl | grep telegraf
```

Auto start the service (after re-boots) with the following command:

```
sudo systemctl enable telegraf.service
```

Download and install grafana

Go to <https://github.com/fg2it/grafana-on-raspberry>

(You will want to check for and use updated instructions / versions / commands.)

(Some instructions / commands will be presented, after you issue the dpkg command.)

Press the raspberry pi 2 and 3 (armv7) Download button in the middle of screen

Save file grafana_5.0.0_armhf.deb whose link is near the bottom of the page

Issue the following command:

```
sudo dpkg -i Downloads/grafana_5.0.0_armhf.deb
```

Follow presented instructions, which for my version, included:

```
sudo /bin/systemctl daemon-reload
sudo /bin/systemctl enable grafana-server
sudo /bin/systemctl start grafana-server
```

Acquire needed mib files, by issuing the following command:

```
sudo apt-get install snmp-mibs-downloader
```

Download zip from:

<https://github.com/WaterByWind/grafana-dashboards>

(Use the green "Clone or download" button, then "Download ZIP" button)

Unzip the file:

```
unzip Downloads/grafana-dashboards-master.zip
```

Configure telegraf

```
cd /etc/telegraf
```

```
cp telegraf.conf telegraf.conf.orig
```

Edit telegraf.conf

Change the line: interval = "10s"

To: interval = "60s"

Change the line: collection_jitter = "0s"

To: collection_jitter = "10s"

Change the line: # username = "telegraf"

To: username = "username"

Change the line: # password = "metricsmetricsmetricsmetrics"

To: password = "password"

Uncomment: # user_agent = "telegraf"

Append the contents of grafana-dashboards-master/UBNT-EdgeRouter/telegraf-inputs.conf to telegraf.conf. You may want to add separator comment line(s) between the sections.

Change the line: agents = ["edgerouter1", "edgerouter2"]

To: agents = ["192.168.3.1"]

```
sudo systemctl restart telegraf.service
```

```
cd /home/pi
```

Check that the service is running with:

```
systemctl | grep telegraf
```

Test telegraf (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory  
/etc/telegraf/telegraf.d --input-filter snmp --test
```

You should see a huge block of data, with no error messages.

Only if you see error messages, will you need to acquire additional mib files from your ER-X's

/usr/share/mibs directory.

(I used WinSCP, which allows files to be copied to/from a Windows PC against another system.)

(You may instead be able to acquire the mib files by other means or over the internet.)

(See also <https://github.com/WaterByWind/grafana-dashboards/issues/3>)

(See also <https://github.com/WaterByWind/grafana-dashboards/issues/1>)

```
mkdir /usr/share/mibs/
```

```
mkdir /usr/share/mibs/site
```

```
chmod ugo+w /usr/share/mibs/site
```

```
cp <mib_files> /usr/share/mibs/site
```

```
cd /home/pi
```

Locally login to grafana, by browsing to <http://localhost:3000>

admin

admin

Login button

Reference: <https://github.com/WaterByWind/grafana-dashboards/tree/master/Extra>

(To enable the Grafana web page to be remotely accessed by computers other than the Pi

(i.e. accessed via PCs on the HomeNetwork), substitute the Pi's IP address for the above "localhost".)

Choose Add data source

Enter the following information:

Name	Telegraf
Type	InfluxDB
URL	http://localhost:8086
Access	direct
Database	telegraf
User	username
Password	password
Press the	Save&Test button

Add a dashboard

1. Hover over the upper-left + button
2. Choose Import from the Create section
3. Enter 1756 into the Grafana.com Dashboard box
4. Press the Load Button
5. Under "Options Name", Enter: UBNT EdgeRouter Dashboard
6. Under "Options Telegraf", Select: Telegraf
7. Press the Import button

The new dashboard should then be selected for you

Under Choose Router, select: 192.168.3.1

If the dashboard is not selected, hover over the "4 squares" upper-left icon, and then select Dashboard <dashboard name>.

You should now be viewing your ER-X's SNMP data graphs.

You can change the time scale of the graphs by clicking on the upper-right clock icon.

=====

Appendix C - Part 2

At some point, I was having occasional network problems and suspected dns as the root problem. Here are some additions to the above grafana setup.

This portion will graph pinging times to web servers, which will test internet access.

Per <https://grafana.com/dashboards/2690>

Append the following to your telegraf.conf:

(You may want to add separator comment line(s) between the sections.)

```
[[inputs.ping]]
  interval = "60s"
  urls = [ "amazon.com", "github.com", "google.com" ]
  count = 4
  ping_interval = 1.0
  timeout = 2.0
```

Restart telegraf

```
sudo systemctl restart telegraf.service
```

Test new telegraf entry (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory
/etc/telegraf/telegraf.d --input-filter ping --test
```

After a few seconds, you should see 3 "> ping" lines.

Add a dashboard

1. Hover over the upper-left + button
2. Choose Import from the Create section
3. Enter 2690 into the Grafana.com Dashboard box
4. Press the Load Button
5. Under "Options Name", Enter: Ping Monitor
6. Under "Options Telegraf", Select: Telegraf
7. Press the Import button

As written, this dashboard seems to have trouble displaying the data sometimes.

The following edits seem to help:

1. Select the Ping Monitor dashboard.
2. Hover over the "Ping Average Response Time" title, and then click on the down caret which appears.
3. Choose Edit
4. Ensure you have the Metrics Tab selected (in the middle of the screen)
5. Go to the line

```
GROUP BY time($__interval) tag(url) fill(null)
```

and click on the word 'null', select 'none' from the list, as in:

```
GROUP BY time($__interval) tag(url) fill(none)
```

Click on the X, which is to the right of all of the graph tabs, to exit editing.

Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

Perform the same change as above i.e. “fill(null)” -> fill(none)”, for the “Packet Loss Percentage” graph.

You should start collecting data. A portion of the screen should eventually look like Figure 170 – Example Grafana Ping Monitor Portion.

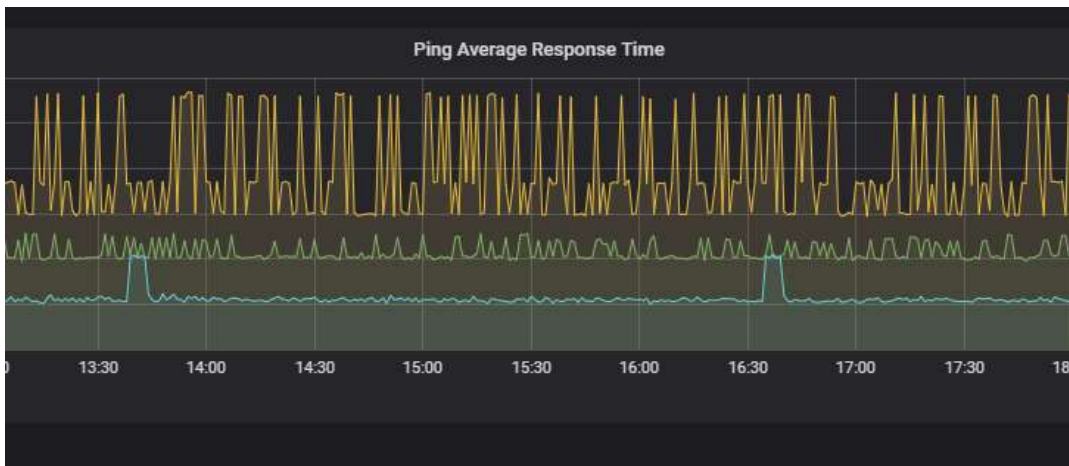

Figure 170 – Example Grafana Ping Monitor Portion

=====

Appendix C - Part 3

This portion will graph dns queries made to multiple dns resolvers.

Per https://github.com/influxdata/telegraf/tree/master/plugins/inputs/dns_query

Append the following to your telegraf.conf:

(You may want to add separator comment line(s) between the sections.)

```
# Dns Query Config:
[[inputs.dns_query]]
  ## servers to query
  servers = [ "192.168.3.1", "209.244.0.3", "8.8.8.8", "9.9.9.9" ]
  ## Network is the network protocol name.
  network = "udp"
  ## Domains or subdomains to query.
  domains = [ "amazon.com", "github.com", "google.com" ]
  ## Query record type.
  ## Possible values: A, AAAA, CNAME, MX, NS, PTR, TXT, SOA, SPF, SRV.
  record_type = "A"
  ## Dns server port.
  port = 53
  ## Query timeout in seconds.
  timeout = 2
```

Restart telegraf

```
sudo systemctl restart telegraf.service
```

Test new entry (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory
/etc/telegraf/telegraf.d --input-filter dns_query --test
```

You should see 12 "> dns_query" lines.

Create a new Dashboard

1. Hover over / click on the "4 squares" upper-left icon, then select Dashboards / Home.
2. Hover over the upper-left + button, choose Create Dashboard
3. Choose Graph
4. Hover over the "Panel Title" title, and then click on the down caret which appears.
5. Choose Edit
6. Select General Tab under Graph
7. In the Title box, enter: ER-X Dns
8. Select Metrics Tab under Graph
9. Under Data Source, select: Telegraf
10. You should see a line which looks like:
"FROM default select measurement WHERE +"
Click on "select measurement" and choose "dns_query"
Click on the + sign and select "server"
Click on "select tag value" and select "192.168.3.1", leave the "=" sign alone.
The line should now look like: "FROM default dns_query WHERE server = 192.168.3.1"

11. You should see a line which looks like:
`"SELECT field(value) mean() +"`
Click on "value" and select "query_time_ms"
Click on "mean()" and select Remove, click on the new + sign and choose max() under Selectors.
The line should now look like: `"SELECT field(query_time_ms) max()"`
12. You should see a line which looks like:
`GROUP BY time($_interval) fill(null) +`
Click on the + sign, and select "tag(domain)".
Select "null" and change into "none"
The line should now look like: `"GROUP BY time($_interval) tag(domain) fill(none)"`
13. Leave the "FORMAT AS Time series line alone.
14. In the ALIAS BY box, enter: `$tag_domain`
15. Select the Graph Axes Tab.
Under the Left Y group change the following:

Y-Min	auto	to	0
Y-Max	auto	to	100
- 16 Click on the X, which is to the right of all of the graph tabs, to exit editing.
17. Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

DNS data should start accumulating. We need a total of four panels, so we will duplicate this panel three times, slightly editing each one.

Duplicate Panel

1. Hover over the "ER-X Dns" title, and then click on the down caret which appears.
2. Select More, then select Duplicate.

Modify New Panel

1. Hover over the NEW "ER-X Dns" title, and then click on the down caret which appears.
2. Select Edit.
3. Select General Tab under Graph
4. In the Title box, change: `ER-X Dns` to `Level3 Dns`
5. Select Graph Metrics Tab under Graph
6. In the FROM line, select 192.168.3.1 and then select (change to) 209.244.0.3
7. Click on the X, which is to the right of all of the graph tabs, to exit editing.
8. Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

Repeat the above "Duplicate Panel" and "Modify New Panel" steps with the following data:

Title Google Dns
server equals 8.8.8.8

Repeat the above "Duplicate Panel" and "Modify New Panel" steps with the following data:

Title Quad9 Dns
server equals 9.9.9.9

My graphs eventually looked like Figure 171 – Example Grafana DNS Queries.

How interesting!

I believe that I will need to investigate and adjust dnsmasq settings in the 75 - Adblocking and Blacklisting section. What I have seems to work, but is definitely non-optimal.

Figure 171 – Example Grafana DNS Queries

=====

Appendix C - Part 4

This portion may someday graph UniFi Access Point information, per the URLs given in Part 1.
